1.0 INTRODUCTION

The Louisiana Department of Transportation and Development (DOTD) and the Interstate 10 (I-10) Corridor Improvement Study Project Team is conducting a Stage 0 Feasibility Study and Environmental Inventory (Feasibility Study) for improvements to I-10 from Louisiana Highway 415 (LA 415) in West Baton Rouge Parish to the I-10 / Interstate 12 (I-12) split at Essen Lane in East Baton Rouge Parish. The proposed project will aim to reduce congestion, improve traffic flow, and improve safety along the corridor. **Figure 1** is the Buffered Project Study Area.

The purpose of this report is to summarize the environmental screening process conducted on the feasible alternatives and to identify resources associated with the natural and human environment as they relate to the I-10 project study area. The mainline and interchange improvement locations are proposed within West and East Baton Rouge Parishes, Louisiana.

1-2

2.0 ALTERNATIVES

Multiple build alternatives for the I-10 Corridor were studied using a Tier 1 Analysis as detailed in Chapter 2 and Appendix A of the Feasibility Study. One mainline alternative and 10 interchange alternatives were accepted to move forward into Stage 1, Planning and Environmental. The interchange locations include LA 415, Louisiana Highway 1 (LA 1), Highland Road-Nicholson Drive, Washington Street, Dalrymple Drive, Perkins Road, Acadian Thruway, College Drive, and the I-10/I-12 Split.

2.1 Mainline Alternative – One Additional Lane

The One Additional Lane alternative would add one additional lane to both the eastbound and westbound directions on I-10 through the project study area, with the exception of the Mississippi River Bridge. While there are existing sound walls along the I-10 mainline in Baton Rouge, preliminary screening for placement of additional sound walls was conducted. Potential locations for sound walls are discussed in Section 3.9 and will be evaluated further in Stage 1.

In the majority of the corridor, adding one lane in each direction can be constructed within the existing right-of-way (ROW). In order for this improvement to take place, interchange modifications would be required.

2.2 Interchange Alternative – LA 415

Two interchanges alternatives west of the Mississippi River Bridge are recommended to move forward. Those options are a Partial Cloverleaf interchange at LA 415 (Lobdell Highway), and a Directional interchange at LA 415.

2.2.1 LA 415 Partial Cloverleaf

This alternative replaces the existing diamond interchange in the southwest quadrant of this interchange with a Partial Cloverleaf. The improvement entails eliminating the left turn conflict point and providing right-hand lane continuous movement.

2.2.2 LA 415 Directional

Similar to the Partial Cloverleaf alternative, this interchange alternative seeks to improve the south to east traffic movement. Currently, motorists travelling south on LA 415 desiring to proceed eastbound on I-10 make an unrestricted left hand turn from a dedicated turn lane. This alternative replaces that movement with a directional ramp. The ramp would cross over the interstate and combine (at-grade) with the existing north to east travel lane before merging with I-10 eastbound traffic.

2.3 Interchange Alternative - Highland-Nicholson

This interchange alternative would lengthen the westbound acceleration and eastbound deceleration lanes on I-10 at this interchange. The lengthening would occur up to the overhead truss (structure) portion of the bridge.

2.4 Interchange Alternative - Washington-Dalrymple

Two interchange alternatives in the Washington Street and Dalrymple Drive area are recommended to move forward. The improvements that are proposed include providing a means to access the Washington Street and Dalrymple Drive area from Interstate 110 (I-110) without crossing multiple lanes of traffic and providing an eastbound ramp onto I-10 in the Dalrymple Drive area.

2.4.1 Washington Street I-110 Left Exit

This alternative provides a left-hand exit ramp on I-110 South for the Washington Street/Dalrymple Drive area. This would improve safety by eliminating the double lane change that I-110 southbound traffic must make at the I-10/I-110 merge in order to exit at Washington Street. The new ramp would intersect at Terrace Street.

Due to the ongoing congestion issues associated with the existing Washington Street exit and minimal environmental effects, this

proposed alternative will be analyzed under a separate Stage 1 study in order to expedite its approval and advancement to funding and construction; it will not be included in the future Stage 1 study for the I-10 Corridor, which will only consider the 10 remaining alternatives (once Washington Avenue has removed for separate study).

2.4.2 Dalrymple/Washington Consolidated Interchange

This alternative includes the concept discussed in Section 2.2.3.1 and adds four additional components. The first is the relocation of the existing eastbound Washington Street and Dalrymple Drive exits to create a dual exit located further west on I-10, thus eliminating the ability for motorists from I-110 to access the exit. The second is the removal of the existing I-10 westbound exit at Louise Street. Access to Louise Street would be via a new frontage road from the Dalrymple Drive exit. The third component is a turnaround under I-10 near Washington Street which would allow motorists from the Dalrymple Drive area to get onto I-10 and travel eastbound. The fourth component is a frontage road on the south side of I-10.

2.5 Interchange Alternative - Perkins Road

The Perkins Road interchange, as it exists, is a partial interchange with only a westbound on-ramp and an eastbound off-ramp. Due to its proximity to the Acadian Thruway interchange, this interchange will be closed to allow for modifications to the Acadian Thruway interchange.

2.6 Interchange Alternative - Acadian Thruway

Three alternatives were evaluated for the Acadian Thruway interchange. One alternative studied the effects of lengthening the acceleration and deceleration lanes of the existing interchange (all directions). The other two alternatives studied the effects of replacing the existing Tight Urban Diamond interchange with alternate interchange configurations.

2.6.1 *Acadian Modification – Ramp Lengthening*

This alternative involves lengthening the acceleration and deceleration lanes of all the existing Acadian Thruway ramps in order to provide a safer merging distance.

2.6.2 *Acadian Modification – Single-Point Diamond*

The Single-Point Diamond interchange configuration would offer the operational advantage of allowing vehicles making opposing left turns to pass to the left of each other instead of to the right. Because left paths do not intersect, this design can eliminate conflict and increase the overall efficiency of the interchange.

2.6.3 *Acadian Modification – Diverging Diamond*

The Diverging Diamond interchange more efficiently facilitates heavy left-turn movements than a traditional diamond. Traffic on the cross route moves to the left side of the roadway for the segment between signalized ramp intersections. This configuration may potentially require moving the existing southern ramp terminals.

2.7 **Interchange Alternative - I-10/I-12 Split - College Direction Ramps**

This alternative would provide dedicated exit lanes to College Drive from both I-10 and I-12. These lanes would separate from I-10 westbound and from I-12 westbound prior to the I-10 / I-12 merge. This would eliminate the current weaving issue at the merge and improve safety by removing the triple lane change.

3.0 AFFECTED NATURAL ENVIRONMENT

In order to comply with DOTD's Stage 0 Manual of Standard Practice, one project study area was created by combining and buffering all alternatives moving forward into the Stage 1 Planning and Environmental (Stage 1) process. Three types of buffers were used depending on the surrounding area and potential construction laydown area needed during design:

- Elevated structures: 100-foot buffer from the outside shoulders
- At-grade segments: 50-foot buffer from the outside shoulders
- At-grade segments with room for laydown: no additional buffer

Each segment was then connected to form one buffered project study area, as shown in **Figures 2a** and **2b**. This project study area was used for all environmental investigations, including the environmental checklist. A preliminary windshield survey was conducted by Providence Engineering and Environmental Group, LLC personnel on May 10, 2016. Photographs taken of the existing project study area can be found as **Appendix A**.

3.1 Prime and Unique Farmland

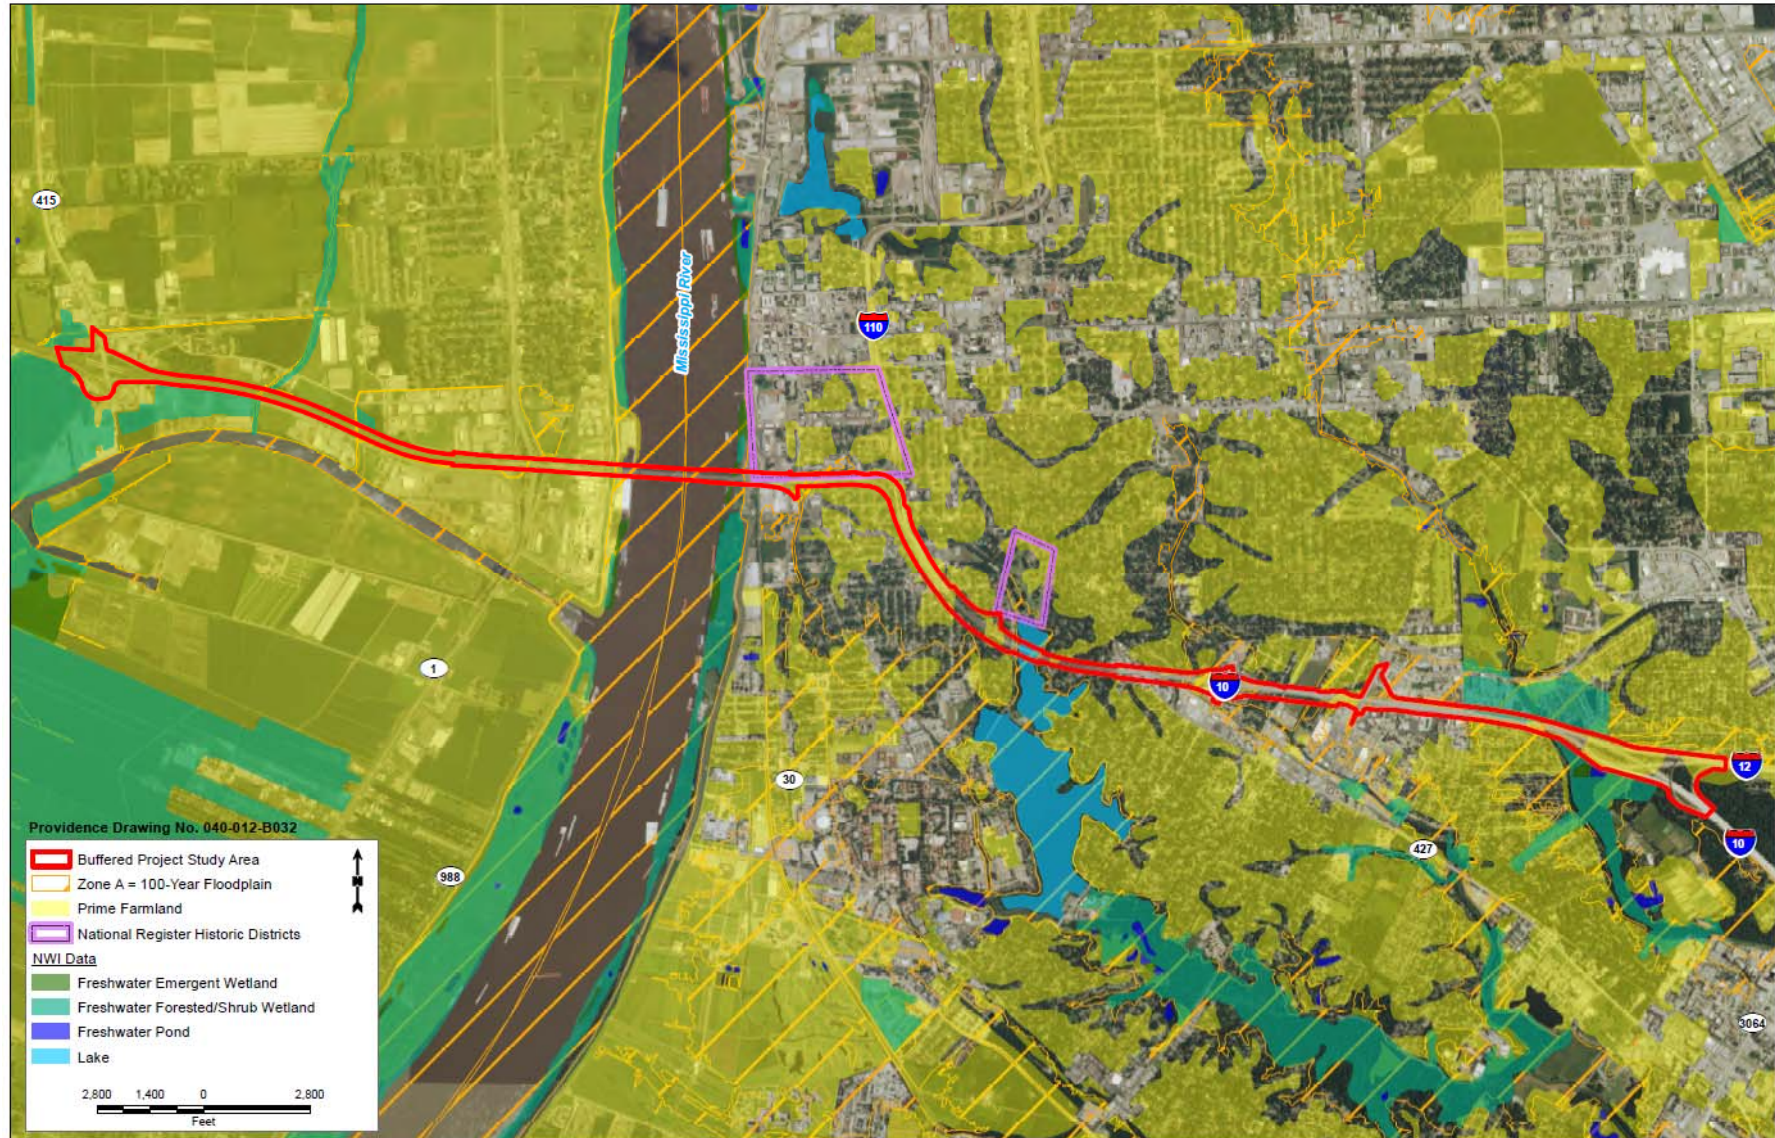

Prime farmland is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops. Prime farmland data was obtained from the Natural Resources Conservation Service (NRCS) Web Soil Survey. There are approximately 253.19 acres of prime farmland in the project study area. According to the NRCS, "Farmland subject to Farmland Protection Policy Act requirements can be forest land, pasture land, cropland, or other land, but not water or urban built-up land." Therefore, only 127.11 acres of potential prime farmland are considered to be in the project study area, based on the removal of urban land from the prime farmland data.

3.2 Threatened and Endangered Species

The Endangered Species Act of 1973 allows the United States Fish and Wildlife Service (USFWS) to manage threatened and endangered species and their ecosystems. Threatened and endangered (protected) species data was obtained from the USFWS Environmental Conservation Online System (ECOS). The ECOS report can be found as **Appendix B-1**.

Protected species listed as potentially present in the project study area include the Pallid Sturgeon (*Scaphirhynchus albus*), West Indian Manatee (*Trichechus manatus*), Alabama Heelsplitter clam (*Potamilus inflatus*), and the Atlantic Sturgeon (*Acipenser oxyrinchus desotoi*). It should be noted that these species are all aquatic and are associated with the Mississippi River, within which no work is proposed.

FIGURE 2A
BUFFERED PROJECT STUDY AREA WITH ENVIRONMENTAL CONSTRAINTS

3-3

3.3 Essential Fish Habitat

Under the Magnuson-Stevens Fisheries Conservation and Management Act of 1996 (Public Law 104-297), the Gulf of Mexico Fishery Management Council identified Essential Fish Habitats (EFHs) for those species managed under its fishery management plans. EFHs are defined by the act as being “those waters and substrate necessary to fish for spawning, breeding, feeding or growth to maturity.” According to the National Oceanic and Atmospheric Administration (NOAA) Habitat Conservation Essential Fish Mapper v3.0, there are no marine environments in the project study area that would support EFHs.

3.4 Wetlands

Wetlands are defined jointly by the United States Army Corps of Engineers (USACE) and the United States Environmental Protection Agency (USEPA) as “those areas that are inundated or saturated by surface or groundwater, at a frequency and duration sufficient to support, and that under normal circumstances, do support, a prevalence of vegetation typically adapted for life in saturated soil conditions” [40 Code of Federal Regulations (CFR) 230.3 and 33 CFR 328.3]. In compliance with Executive Order (EO) 11990, a preliminary desktop wetland investigation was conducted on the proposed project study area using soils data and local knowledge. Wetlands are potentially present where hydric soils exist. Field investigations are required to accurately delineate the site.

Preliminary wetlands data was pulled from the National Wetlands Inventory (NWI) for the project study area. There are approximately 11.24 acres of Freshwater Forested/Shrub Wetland and 0.59 acres of Freshwater Emergent Wetland.

A search was performed for properties enrolled in the Wetlands Reserve Program (WRP). No WRP properties were found within or adjacent to any of the alternatives. The WRP data was received from the NRCS on February 12, 2016.

3.5 Waters Resources

3.5.1 Surface Water

Water quality in the project study area is affected by both point source and nonpoint source discharges. Point sources include industrial, municipal, and sewer discharges. Nonpoint sources include storm water runoff, landscape maintenance activities, agriculture, and natural sources. The Mississippi River is the largest water body in the project study area. Smaller waterways in the general project study area include Bayou Choctaw, Bayou Manchac, Broussard Bayou, and Dawson Creek. Water resources are shown on **Figures 2a** and **2b**.

A review of the 2014 *Louisiana Water Quality Inventory: Integrated Report - Fulfilling the Requirements of the Federal Clean Water Act Sections 305(b) and 303(d)* revealed that the project study area lies within the Lake Maurepas and Lower Mississippi Basins. The following information on each subsegment was detailed in the 2014 Louisiana Water Quality Inventory:

- Subsegment 070301 – Mississippi River – from Monte Sano Bayou to Head of Passes. This subsegment is fully supporting all of its designated uses including, primary contact recreation, secondary contact recreation, fish and wildlife propagation, and drinking water supply.
- Subsegment 120103 – Bayou Choctaw – from Bayou Poydras to Bayou Grosse Tete. This subsegment does not meet the designated use of fish and wildlife propagation. Low dissolved oxygen believed to be due to agriculture is listed as the cause of impairment for fish and wildlife propagation. A dissolved oxygen Total Maximum Daily Load (TMDL) was developed for this subsegment. This subsegment is on Louisiana's 2014 Water Quality Inventory: Integrated Report (305(b)/303(d)) list.
- Subsegment 040201 – Bayou Manchac – from headwaters to Amite River. This subsegment is listed as not meeting the designated use of fish and wildlife propagation. This subsegment was previously listed as impaired for dissolved oxygen for which a TMDL was developed. Nitrate/nitrite (nitrite + nitrate as N), phosphorus (Total), and dissolved oxygen believed to be elevated due to on-site treatment systems (septic systems and similar decentralized systems) and natural sources are listed as the causes of impairment for fish and wildlife propagation. In addition, chloride, sulfates, and total dissolved solids believed to be elevated due to natural sources are also listed as the causes of impairment for fish and wildlife propagation. This subsegment is on Louisiana's 2014 Water Quality Inventory: Integrated Report (305(b)/303(d)) list.
- Subsegment 040602 – Lake Maurepas. This subsegment does not meet the designated use of fish and wildlife propagation. Non-native aquatic plants believed elevated due to introduction of non-native organisms (accidental or intentional) are listed as the causes of impairment for fish and wildlife propagation. This subsegment is on Louisiana's 2014 Water Quality Inventory: Integrated Report (305(b)/303(d)) list.

3.5.2 Groundwater

According to the USEPA, a Sole Source Aquifer (SSA) is an aquifer that normally supplies at least 50% of the drinking water for a particular community or area where no viable alternative drinking water source exists. USEPA mapping data shows the entire project study area falls within the Southern Hills Aquifer System (Buono, 1983). The project study area also falls within the Alluvial and Southeast Louisiana aquifer systems. The USEPA's SSA program will be consulted as part of the Stage 1 process to ensure the project does not adversely affect the aquifer.

A search was performed for water wells, including public water supply wells, using the Louisiana Department of Natural Resources (LDNR) Strategic Online Natural Resources Information System (SONRIS) database. The SONRIS database includes all water wells registered to DOTD. A Public Water System is any water system that provides water to at least 25 people for a minimum of 60 days annually. A total of 18 wells are within the buffered project study area of this project, including two active abandoned observation wells, two active monitor wells, eight active piezometer wells, and six plugged and abandoned wells. **Figure 2b** shows all water wells in the vicinity of the project study area. It is possible that additional wells have been drilled in the project study area but are not registered.

3.6 Floodplains

EO 11988 "Floodplain Management" requires federal agencies to avoid actions, to the extent practicable, which will result in the location of facilities within floodplains and/or affect floodplain values. Facilities located in a floodplain may be damaged or destroyed by a flood or may change the flood-handling capability of the floodplain or the pattern or magnitude of the flood flow. The Mississippi River's historical floodplains are protected from flooding associated with high river elevations by the mainline Mississippi River Levee system. As this levee system provides protection for a myriad of land uses, construction activities within 1,500 feet of the toe of the levee require separate analysis and permitting.

Federal Emergency Management (FEMA) Flood Insurance Rate Maps (FIRMS) were used to determine the extent of the 100-year floodplain in the project study area. The project study area may affect approximately 87.82 acres of 100-year floodplain in Zones A and AE (see **Figure 2a**). Additional coordination with the local floodplain administrators will occur during Stage 1 to mitigate impacts to floodplains including avoidance and minimization through design.

3.7 Natural and Scenic Rivers

The Louisiana Natural and Scenic River Act of 1970 established the Louisiana Natural and Scenic River System, a state river protection initiative to limit impacts to those rivers, streams, and bayous afforded protection through the Act. The Louisiana Department of Wildlife and Fisheries (LDWF) was charged with regulatory authority over the program. There are no federal designated Wild or Scenic Rivers or state designated Natural and Scenic Rivers in the project study area.

3.8 Unique and Environmentally Sensitive Areas

The DOTD Office of Engineering in the Engineering Directives and Standards Manual (EDSM; No: I.1.1.21) Treatment of Significant Trees in DOTD Right-of-Way defines, for the purposes of this policy, a significant tree as a Live Oak, Red Oak, White Oak, Magnolia, or Cypress that is considered aesthetically important, 18-inches or greater in diameter at breast height (4-6 feet above the ground), and having a form that separates it from the surrounding vegetation or is considered historic. Additionally, significant trees must be in good health and not in a declining condition. Two potentially significant trees were observed during the windshield investigation, both located in the northeastern quadrant of the College Drive / I-10 interchange. No other significant trees were observed during the windshield survey; however, a more extensive field visit will be conducted as part of the Stage 1 and will confirm these findings along with coordinates of identified significant trees.

3.9 Noise

The Federal Highway Administration (FHWA) has established noise abatement criteria (NAC) for various land use activity categories that can be used to determine when a traffic noise impact would be expected to occur. The DOTD's noise policy defines traffic noise levels as "approaching" when the noise level is at least one A-weighted decibel (dBA) below the FHWA NAC. The DOTD policy also states a 10 dBA increase over existing levels is a substantial increase. In accordance with current FHWA noise regulations, the Traffic Noise Model version 2.5 computer program was used to predict the noise levels associated with future improvements and widening to the project study area.

Because traffic sound levels are never constant due to the changing number, type, and speed of vehicles, a single value is used to represent the average or equivalent steady-state sound level (Leq). For traffic noise assessment purposes, Leq is typically evaluated over the worst one-hour period and is defined as Leq(h).

A traffic noise screening analysis was completed by Bowlby & Associates, Inc. for this project in February 2014 in accordance with FHWA and DOTD noise standards. The objective of this study was to identify areas with likely residential noise impacts and identifying impacted areas where traffic noise barriers should be studied in Stage 1.

For this project, because the existing noise environment is dominated by I-10 traffic, it was determined unlikely that any noise impacts created by the project would exceed the existing Leq(h) by 10 dBA or more. Residential lands, Category B, represent the vast majority of potentially impacted land use along the project study area. Therefore, noise impacts were identified, and noise abatement evaluated where predicted future noise levels were 66 dBA or more.

Noise predictions indicated noise impacts out to 450-500 feet from the edge of the closest travel lane for both at-grade and elevated roadway cross sections. A total of eight new potential noise barriers were studied, and of these, seven were assumed to be acoustically feasible and reasonable by DOTD's standards. Barrier WB4A's cost per benefitted residence was above the \$36,000 cost effectiveness criterion. For screening purposes, a \$36,000 cost criterion was used but DOTD's Highway Traffic Noise Policy states a cost effectiveness criterion of \$35,000. However, it was relatively close to meeting this criteria and should still be analyzed in Stage 1. The estimated construction cost of the eight barriers is approximately \$11.8 million. Below is a summary of the eight barriers:

- Barrier EB1 begins east of Highland Road and parallels the eastbound lanes of I-10 until E. Washington Street. This barrier is estimated to benefit 133 residences with an estimated construction cost of \$2.2 million.
- Barrier EB2 begins near E. Washington Street along the elevated roadway structure of eastbound I-10 to the exit ramp to Dalrymple Drive. This barrier is estimated to benefit 64 residences with an estimated construction cost of \$1.3 million.
- Barrier EB3 begins near City Park Lake along the elevated roadway structure of eastbound I-10 to the Perkins Road exit near Cedardale Avenue. This barrier is estimated to benefit 102 residences with an estimated construction cost of \$1.7 million.
- Barrier WB1 begins south of Government Street and parallels the southbound lanes of I-110 and the ramp to westbound I-10. This barrier is estimated to benefit 55 residences with an estimated construction cost of \$1.6 million.
- Barrier WB2 begins along the westbound I-10 entrance ramp from E. Washington Street and continues to the I-110 exit ramp to Government Street. This barrier is estimated to benefit 67 residences with an estimated construction cost of \$1.9 million.

- Barrier WB3 begins along the westbound I-10 entrance ramp at Dalrymple Drive and continues along I-10 to the Louise Street exit ramp near Pearl Street. This barrier is estimated to benefit 42 residences with an estimated construction cost of \$1.0 million.
- Barrier WB4A begins west of Christian Street along the elevated roadway structure of westbound I-10 to City Park Lake. This barrier is estimated to benefit 28 residences with an estimated construction cost of \$1.1 million.
- Barrier WB4B begins along the westbound I-10 entrance ramp from S. Acadian Throughway and continues to the east of the Perkins Road entrance ramp merge point. This barrier is estimated to benefit 38 residences with an estimated construction cost of \$1.0 million.

The details of each barrier including location, length, and heights are not precise, but are to serve as a baseline that will be further examined during Stage 1. Additional barrier locations along the mainline of I-10 should be analyzed during Stage 1 for the entrance/exit ramp barriers of Barriers EB2, EB3, and WB4B.

Existing noise barriers were also examined for potential impacts and possible barrier enhancements. Brief noise measurements taken behind barriers indicated current traffic noise levels were close to or above the 66 dBA NAC level, meaning there could be potential noise impacts for residential areas. Four areas where possible barrier enhancements may be needed were identified and are shown in red on Figures 14 and 17 of the analysis report. Potential barrier enhancements for these areas will be studied in Stage 1.

It is important to note, the final determination of acoustic feasibility and reasonableness for barriers or other noise abatement measures will be made during Stage 1. The entire traffic noise screening analysis including specific barrier locations and details can be found in **Appendix C**.

3.10 Air Quality

The proposed project is in East Baton Rouge and West Baton Rouge Parishes, which both are considered air quality nonattainment areas for ozone (O₃) with a marginal designation, as per the 2008 8-Hour Classifications. Nonattainment is described by the USEPA Green Book Designations as any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant. Areas with a marginal nonattainment ozone classification under the 2008 8-Hour Classifications have a design value of 0.076 parts per million (ppm) O₃ up to but not including 0.086 ppm O₃. Both parishes are part of the Baton Rouge 5-parish area that was designated by USEPA in July 2012 as a marginal nonattainment area for the 8-hour ozone standard; therefore, the

transportation conformity rules do apply. The Baton Rouge area is considered in attainment or unclassifiable with respect to all other National Ambient Air Quality Standards pollutants including carbon monoxide.

3.11 Cultural Resources

A preliminary assessment of cultural resources formerly documented in the project study area was conducted. Data reviewed included previously recorded archaeological sites, cultural resources investigations, and properties listed on the National Register of Historic Places (NRHP).

Based on data gathered from the Louisiana Department of Culture, Recreation, and Tourism's Office of Cultural Development, Division of Archaeology, Louisiana Cultural Resources Map, there is one historic district in the project study area and one adjacent. The Beauregard Town Historic District (NRHP #83000500) is within the project study area located just north of I-10 by the I-10/I-110 split. City Park Golf Course (NRHP #020001546) is adjacent to the project study area and is part of the City-Brooks Community Park. No direct effects on the districts are anticipated. There are no known archaeological sites located within the project study area. Multiple Louisiana Historic Resource Inventory standing structures are shown within the buffered project study area on the Louisiana Cultural Resources Map, but no additional information other than location is provided. The exact location and further details of standing structures and other cultural resources will be investigated and confirmed as part of the Phase I Cultural Resources Survey to be conducted during Stage 1.

3.12 Hazardous and Solid Waste Concerns

A survey of the project study area was conducted to identify sites that contain or potentially contain hazardous or toxic materials and/or wastes. Environmental Data Resources, Inc. (EDR) was contracted to provide a search of the project study area, using the standard American Society for Testing and Materials (ASTM) format for Phase I Environmental Site Assessments (ESAs). The EDR report included regulatory agency record reviews, including a search of federal and state environmental compliance databases. A list of 91 orphan wells was included in the EDR report. Public data sources were exhausted, and based on this search, it was determined that ten of the 91 orphan sites were located in the project study area. A Phase I ESA will be conducted as part of the Stage 1 and will further examine hazardous and solid waste concerns.

The database search was conducted to determine what, if any, information, release reporting, or registrations exist, or have been applied for, which might reveal a potential for contamination, indicate the possible presence of contamination, or assist in identifying recognized environmental conditions in connection with the project study area. The databases searched include: Federal ASTM E 1527-13 Databases, Federal ASTM E

1527-13 Supplemental Databases, and State ASTM E 1527-13 Databases. Two types of sites were considered to be of particular interest for this project:

- Sites where hazardous materials or wastes are generated, stored, handled, or disposed
- Sites containing underground storage tanks (USTs)

These sites, should they be contaminated, have the potential to directly impact the project study area if located in the existing or proposed ROW, or indirectly through migration of contamination off site and into the project ROW. Sites discussed in this section are identified as Potential Environmental Liability site on **Figure 2b**. A complete Phase I ESA will be conducted during Stage 1 to ascertain whether any of the sites identified in this preliminary search elicit environmental liability concerns.

3.12.1 Hazardous Waste Sites

Hazardous waste is defined by 42 United States Code § 6903 as “a solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may (A) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (B) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed.” Potential hazardous waste sites in the search area identified by the EDR Report are shown on **Figure 2b**. A copy of the EDR report can be found in **Appendix B-2**.

One Resource Conservation and Recovery Act (RCRA) – Conditionally Exempt Small Quantity Generator is located in the project study area. Three RCRA Non-Generators are also located in the project study area.

SPILLS is a database of spills and/or releases, to land, reported to the Emergency Response Section of the Louisiana Department of Environmental Quality (LDEQ). This list revealed 16 sites in the project study area. Of these, two have an open incident status and one was referred to remediation.

LA REM is a database of facilities or sites that come to the LDEQ UST and Remediation Division through self-notification or referral. Three REM sites were located in the project study area.

The Integrated Compliance Information System provides a database that contains all Federal Administrative and Judicial enforcement actions, including information on Incident Tracking, Compliance

Assistance, and Compliance Monitoring. Two such sites were located within the project study area.

The National Pollutant Discharge Elimination System is a listing of sites with a Louisiana Pollutant Discharge Elimination System (LPDES) program issued permit. Five sites were found in the project study area.

EDR has compiled a list of potential gas stations, gasoline stations, filling stations, auto, automobile repair, auto service stations, and service stations sites. This list comprises "High Risk Historical Records." Fifteen sites falling in this category were found within the project study area.

3.12.2 Underground Storage Tanks

USTs are defined as any one or combination of tanks used to contain regulated substances, the volume of which, including connecting underground pipes, is ten percent or more beneath the surface of the ground. The LDEQ requires by law that all USTs within the state be registered. The data search queried UST records maintained by the LDEQ.

The preliminary EDR report identified 22 UST sites in the search area, all of which are in the project study area. Of these, 13 are removed USTs, five are active, three are open, and one is closed. Six Historical Incident Leaking USTs were identified in the project study area. No Leaking USTs were found in the project study area.

3.12.3 Oil and Gas Wells

To determine the location of oil and gas wells in the project study area, data was obtained from the LDNR's SONRIS database system. There are no registered oil and gas wells within the alternative ROW's. It is possible that wells have been drilled in the project study area but are not registered.

4.0 AFFECTED HUMAN ENVIRONMENT

4.1 Land Use

Land use categories within and adjacent to the project study area include agricultural land, commercial, forest, forested wetland, industrial, residential, urban or other built up land, and water. This data was initially obtained from the United States Geological Survey (USGS) data set and was updated based on aerial photography.

4.2 Community Demographic

The project study area falls between two parishes and twelve different census tracts, including: Tracts 14, 21, 22, 23, 25, 26.01, 27, and 38.01 in East Baton Rouge Parish and Tracts 201, 202, 203, and 204 in West Baton Rouge Parish. Demographic data for these tracts relating to the project study area's employment status, industry, transportation methods, *etc.* was obtained from the United States Census Bureau (USCB), 2006-2010 American Community Survey (ACS) 5-Year Estimates. **Figure 3** and **Table 4-1** provide details on the minority population present in the census tracts that comprise the buffered project study area. The data was available on the USCB's American Fact Finder (AFF) website and is the most recent data currently available for the project study area. Demographic data for these tracts relating to housing units, educational attainment, age groups, language spoken, and poverty data was obtained from the ACS 5-Year Estimates for 2008-2012 (see **Tables 4-2** and **4-3**).

In accordance with the FHWA Order 6640.23A and the United States Department of Transportation (DOT) Order 5610.2(a), a minority means a person who is Black, Asian American, American Indian/Alaskan Native, Native Hawaiian/Other Pacific Islander, or Hispanic (regardless of race). Therefore, the total population minus the "white alone" population was used to determine the minority population. According to the census tract data, five census tracts support minority and/or low income populations, including Tracts 21, 22, 25, and 27 in East Baton Rouge Parish, and Tract 201 in West Baton Rouge Parish.

	Percent	-	71.0%	27.3%	0.2%	0.1%	0.0%	0.8%	0.6%	1.7%	29.0%

NOTES:

1. Since all Hispanics regardless of race are considered a minority, the population with Hispanic ethnicity is identified in this column, and all the other race categories do not include Hispanic ethnicity.

2. In accordance with FHWA Order 6640.23A and DOT Order 5610.2, a minority means a person who is Black, Asian American, American Indian/Alaskan Native, or Hispanic (regardless of race). To determine the number of minorities, the total population minus the "white alone" population was determined.

NOTES:
1. Although the ACS produces population demographic and housing unit estimates, for 2010, the 2010 Census provides the official counts of the population and housing units. For 2006 to 2009, the Population Estimates Program provides intercensal estimates of the population for the nation, states, and counties.
2. An estimated margin of error was given for each category and is available on the AFF website.

4.3 Environmental Justice Analysis

EO 12898, Federal Actions to Address Environmental Justice (EJ) in Minority Populations and Low-Income Populations (February 11, 1994), specifies actions to be taken on a range of issues that are intended to promote nondiscrimination in federal actions to provide minority and low-income communities equal access to public information regarding a federal action, and to provide an opportunity for public participation in the evaluation of a federal action in matters relating to human health and the environment. Low income can be defined as a population whose median household income is at or below the Department of Health and Human Service poverty guidelines. A demographic profile for the Census tracts comprising the project study area was prepared to answer the following questions posed by EO 12898:

- Does the potentially affected community include minority and/or low-income populations?
- Are the environmental impacts likely to fall disproportionately on minority and/or low-income members of the community and/or tribal resources?

The population/minority and poverty data obtained from the USCB AFF website are illustrated on **Tables 4-1** and **4-3** and on **Figures 3 and 4**. As discussed in Section 4.2, five census tracts support minority and/or low income populations. Based on this data, there are potential EJ concerns which will be considered further during Stage 1.

FIGURE 4
POVERTY DATA

4.4 Community Facilities

Community facilities and services in the project study area were initially identified using Google Earth. The Recreation and Park Commission of East Baton Rouge Parish (BREC) webpage was referenced for a map of BREC facilities that may be in the project study area. The boundaries for Expressway Park were derived from the September 28, 1970 Joint Use Agreement between BREC and DOTD. Three BREC parks are located immediately adjacent to I-10 or I-110, and one is in close proximity to I-10 off of East Lakeshore Drive. The parks are as follows:

- Expressway Park – located adjacent to and under I-110/I-10 bounded by I-110, Myrtle Street, South 11th Street, and Maximillian Street
- East Polk Street Park – located adjacent to I-10 (south side) between Carolina Street and Dalrymple Drive at the end of East Polk Street
- Nairn Park – located adjacent to I-10 (south side) immediately east of Nairn Drive
- City-Brooks Community Park – located between Broussard Street, Dalrymple Drive, and East Lakeshore Drive

Two Louisiana Cultural Districts are located in the project study area: the Perkins Road Arts District and Old South Baton Rouge District. The Perkins Road Arts District is located at the Perkins Road and I-10 overpass area, and the Old South Baton Rouge District is bordered by South River Road on the west, Chimes Street on south, Dalrymple Drive on the east, and South Boulevard on the north. The Louisiana Cultural Districts Program was created by Act 298 of the 2007 Regular Session of Legislature to spark community revitalization based on cultural activity through tax incentives (LOCD, 2016). Cultural Districts are not afforded any protections through the National Historic Preservation Act of 1966.

5.0 PERMITS

Permits that may be required to implement the proposed project include:

- USACE Section 10/404 Permit
- Clean Water Act Section 401 Water Quality Certification
- United States Coast Guard Bridge Permit
- LPDES Permit
- Local Levee District Permits

Trust resources in this location are managed by:

Louisiana Ecological Services Field Office

646 Cajundome Boulevard, Suite 400

Lafayette, LA 70506-4290

(337) 291-3100

Endangered Species

Proposed, candidate, threatened, and endangered species are managed by the [Endangered Species Program](#) of the U.S. Fish & Wildlife Service.

This USFWS trust resource report is for informational purposes only and should not be used for planning or analyzing project level impacts.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list from the Regulatory Documents section.

[Section 7](#) of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency.

A letter from the local office and a species list which fulfills this requirement can only be obtained by requesting an official species list either from the Regulatory Documents section in IPaC or from the local field office directly.

The list of species below are those that may occur or could potentially be affected by activities in this location:

Clams

Alabama (=inflated) Heelsplitter *Potamilus inflatus* Threatened

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=F01Q

Fishes

Atlantic Sturgeon (gulf Subspecies) *Acipenser oxyrinchus* Threatened

(=oxyrinchus) desotoi

CRITICAL HABITAT

There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=E04W

Pallid Sturgeon *Scaphirhynchus albus* Endangered

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=E06X

Mammals

West Indian Manatee *Trichechus manatus*

Endangered

CRITICAL HABITAT

There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?sPCODE=A007

Critical Habitats

There are no critical habitats in this location

Migratory Birds

Birds are protected by the [Migratory Bird Treaty Act](#) and the [Bald and Golden Eagle Protection Act](#).

Any activity that results in the take of migratory birds or eagles is prohibited unless authorized by the U.S. Fish & Wildlife Service.^[1] There are no provisions for allowing the take of migratory birds that are unintentionally killed or injured.

Any person or organization who plans or conducts activities that may result in the take of migratory birds is responsible for complying with the appropriate regulations and implementing appropriate conservation measures.

1. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

Additional information can be found using the following links:

Bird of conservation concern

Wildlife refuges and fish hatcheries

There are no refuges or fish hatcheries in this location

Wetlands in the National Wetlands Inventory

Impacts to [NWI wetlands](#) and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local [U.S. Army Corps of Engineers District](#).

DATA LIMITATIONS

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

DATA EXCLUSIONS

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tubercid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

DATA PRECAUTIONS

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

This location overlaps all or part of the following wetlands:

Freshwater Emergent Wetland

[PEM1C](#)

2.52 acres

Freshwater Forested/shrub Wetland

[PSS1A](#)

128.0 acres

[PFO1A](#)

126.0 acres

[PFO1Ad](#)

117.0 acres

Lake

L1UBHx

48.2 acres

Riverine

R2UBH

43600.0 acres

A full description for each wetland code can be found at the National Wetlands Inventory website: <http://107.20.228.18/decoders/wetlands.aspx>

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 01/11/2016 has revealed that there are 3

EXECUTIVE SUMMARY

SEMS sites within the searched area.

<u>Site</u>	<u>Address</u>	<u>Map ID</u>	<u>Page</u>
CLEARWATER FLUIDS RE	1001 SOUTH FIRST ST.	45	276
US ARMY CORPS OF ENG	2101 ERNEST WILSON D	52	309
MCKINLEY HIGH SCHOOL	800 E. MCKINLEY STRE	76	395

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 01/11/2016 has revealed that there are 3 SEMS-ARCHIVE sites within the searched area.

<u>Site</u>	<u>Address</u>	<u>Map ID</u>	<u>Page</u>

VALLEY PARK SCHOOL	4510 BAWELL ST.	61	331
2011 MISSISSIPPI RIV	10930 HWY 67	67	353

LIENS 2: A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

A review of the LIENS 2 list, as provided by EDR, and dated 02/18/2014 has revealed that there is 1 LIENS 2 site within the searched area.

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/09/2015 has revealed that there is 1 RCRA-LQG site within the searched area.

EXECUTIVE SUMMARY

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 11 RCRA-SQG sites within the searched area.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 34 RCRA-CESQG sites within the searched area.

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/09/2015 has revealed that there are 23 RCRA NonGen / NLR sites within the searched area.

EXECUTIVE SUMMARY

US AIRS: The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

A review of the US AIRS list, as provided by EDR, and dated 10/20/2015 has revealed that there are 3 US AIRS sites within the searched area.

EXECUTIVE SUMMARY

EDR PROPRIETARY RECORDS

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within the searched area.

<u>Site</u>	<u>Address</u>	<u>Map ID</u>	<u>Page</u>
BATON ROUGE GAS WORK	LAUREL STREET	3	27

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 68 EDR Hist Auto sites within the searched area.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical

EXECUTIVE SUMMARY

Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 31 EDR Hist Cleaner sites within the searched area.

LA RGA LUST: The EDR Recovered Government Archive Leaking Underground Storage Tank database provides a list of LUST incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the Department of Environmental Quality in Louisiana.

A review of the LA RGA LUST list, as provided by EDR, has revealed that there are 6 LA RGA LUST sites within the searched area.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

5	CRACKER BARREL STORE #28 133 LOBDELL HWY PORT ALLEN, LA 70767 FINDS: Registry ID: 110020557146 Environmental Interest/Information System US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality. ECHO: Envid: 1008161286 Registry ID: 110020557146 DFR URL: http://echo.epa.gov/detailed_facility_report?fid=110020557146	FINDS ECHO	1008161286 N/A

Environmental Interest/Information System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and

it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Incident Desc: 0
Incident Type Desc: UST Release, Dispenser / Physical or Mechanical Damage
Comments: This site visit was made in response to incident # 124895 in which this facility self-reported a spill of gasoline. This spill occurred when a customer impacted dispenser # 5 & 6 with his vehicle. This impact caused the gasoline sheer valve to dislodge slightly causing a temporary release of gasoline. Apparently, there was insufficient separation at this sheer valve to cause it to engage. Facility personell responded by shutting down all dispensers with the emergency shut off switch located inside the main building. The diesel sheer valve, located in the same dispenser, was not affected. Energy Equipment, Inc. was called and responded by replacing and setting the sheer valve top assembly. Energy Equipment called Gator Environmental to the remove a total of 24 gallons of gasoline which had collected in the dispenser sump. There was no impact to the native soil or groundwater as all spilled product was contained in the dispenser sump or confined to the surrounding concrete surface. LP

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Comments: Werner Enterprises Inc. January 14, 2010 Tempo# 120774 On January 14, 2010 at approximately 1230 hours, Louisiana Department of Environmental Quality Emergency Responder (LDEQ-ER) Bryan Riche responded to 770 Allendale Drive in Port Allen concerning a diesel fuel spill. According to Mr. Gary Weiss of American Compliance Technologies, a Werner Enterprises Inc. tractor-trailer was parked in the drop yard when an employee noticed a leak from the left side saddle tank. Approximately forty gallons of diesel fuel impacted the concrete pavement and entered a nearby catch basin. Oil Mop responded to cleanup the spilled diesel. Free phase liquid diesel fuel was removed and booms will be placed in two catch basins and at the outfall for further removal. No road closures, fires or injuries were reported as a result of this incident. Further action by LDEQ-ER pending results of investigation. BPR.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

LA HIST LUST INCIDENT:

Comments: DEQ INSPECTION 7/17/92 WAS MADE DUE TO THE REMOVAL OF ONE 2000 GLUST. THE TANK WAS WASHED AND DEGASED. NATIONAL WASTE OIL WAS ONSITE DRAINING THE RESIDUALS OUT OF THE UST. THE TANK HAD PERFORATIONS WHICH POSSIBLY CAUSED THE RELEASE. THE TANK HAD BEEN OUT OF OPERATION FOR APPROX. 7 YEARS. THE CONTAMINATED SOILS WERE PLACED ON VISQUEEN TO AERATE. DEQ LETTER 2/10/93 REQUEST A SKETCH OF THE SITE DEPICTING UST AND SAMPLING LOCATIONS BEFORE FURTHER PROCESSING CLOSURE REQUEST.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US BROWNFIELDS:

Recipient name: Baton Rouge-Parish of East Baton Rouge, City of
Grant type: Assessment
Property name: BR 182
Property #: Not reported
Parcel size: 6
Property Description: The property is currently vacant and unused. The property had a wholesale hay and feed store developed in the northwest corner of the property in 1908 until 1911. A lumber yard operated on the western portion of the property from 1911 until the 1940s. Baton Rouge Electric Light Plant operated an electrical generation plant from 1916 until the 1940s. Gulf States Utilities Co. operated an electrical substation at the property from the 1940s until the 1970s. Gulf States Utilities Co. used the property for storage, day to day operations, and business operations from the 1970s until the 1990s. Entergy used the property for financial, business, and paperwork activities, maintenance and repair operations, and storage from the 1990s until 2011. The property has been vacant and unused since the end of 2011.

Registry ID: 110009578386

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Registry ID: 110054627043

Environmental Interest/Information System

US EPA Assessment, Cleanup and Redevelopment Exchange System (ACRES) is an federal online database for Brownfields Grantees to electronically submit data directly to EPA.

Environmental Interest/Information System
TSCA SUBMITTER

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

PERSONAL TOUCH CAR WASH AND USED TIRE 1320 HIGHLAND ROAD BATON ROUGE, LA 70802

US BROWNFIELDS 1014722356
N/A

US BROWNFIELDS:

Recipient name: Louisiana Department of Environmental Quality
Grant type: Section 128(a) State/Tribal
Property name: PERSONAL TOUCH CAR WASH AND USED TIRE
Property #: E. Baton RougeParish, Suburb Magnolia, Lots 1-7, B Square 279
Parcel size: 1.44
Property Description: History of automotive repair, car wash, tire repair
Latitude: 30.436033
Longitude: -91.185347
HCM label: Address Matching-Block Face
Map scale: Not reported
Point of reference: Entrance Point of a Facility or Station
Datum: World Geodetic System of 1984
ACRES property ID: 50221
Start date: Not reported
Completed date: Not reported
Acres cleaned up: Not reported
Cleanup funding: Not reported
Cleanup funding source: Not reported

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

45 BATON ROUGE MUNICIPAL DOCK - LDEQ US BROWNFIELDS FINDS ECHO 1012109047 N/A
1100 - 1300 RIVER ROAD
BATON ROUGE, LA 70802

US BROWNFIELDS:

Recipient name: R6 Brownfields TBA (previously Superfund TBA)
Grant type: TBA
Property name: BATON ROUGE MUNICIPAL DOCK - LDEQ
Property #: Not reported
Parcel size: 15.26
Property Description: The site was occupied by Capital City Oil Mill until around 1923. The dock was constructed in the 1920s and was used as a port until around 1960. A storm water pump station is located near the center of the property. The pump station is used for drainage of stormwater from downtown Baton Rouge into the Mississippi River. The docks have been vacant since the 1960s. The dock structure is still in place (PPF - Baton Rouge Municipal Dock, 7/19/06).

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Incident Desc: s14-42292UST - Gasoline seeping from the ground. col
Incident Type Desc: UST Release, Submersible Turbine Pump / Physical or Mechanical Damage
Comments: Confirmed Release = 4/28/14On 04/28/2014 @ 04:30am, I was on ER duty and received a call from SPOC. Cracker Barrel Convenience and gas station had gasoline emerging from an underground source. The store was closed and gasoline was seeping from the ground. Baton Rouge police and fire departments were on the scene. Air monitoring was being conducted with the results were nothing detected. I called Cracker Barrel's weekend emergency contact, Mike Butcher, in Lafayette, La. Mr. Butcher had limited information by only knowing there was a leak and that gasoline was on the ground. Mr. Butcher stated that he had called his emergency contact numbers in Baton Rouge and that Gator Environmental had been dispatched and Tank Testers were on the way. Upon arrival at Cracker Barrel, the State Police were onsite, Tank Testers, Baton Rouge Fire Department, Baton Rouge Police Department and Gator Environmental had not arrived. I spoke with the State Police and the Tank Testers supervisor. The amount of gasoline released was unknown. The clerk inside the Cracker Barrel store listed the loss amount as unregistered. The Tank Testers stated that the gas pumps had been activated by a customer which caused the pumps to prime up. The pumps were never de-activated so the pressure caused an o-ring on the pumps to fail causing the release. The release was confined to the manhole entry to the pumps. Tank Testers had dipped out the gasoline and the loss partially filled a 5-gallon bucket. On May 8, 2014, I received an e-mail from Cracker Barrel which was their notification letter. In the letter, it stated that the loss of gasoline from the station was calculated at 250 gallons. On May 15, 2014, I spoke with Larry Pentecost in UST/Remediation. Mr. Pentecost had received the information from SPOC at the same time that I did. UST/Remediation is already working the Cracker Barrel incident. JAK Site visit on 4-29-14. By this time, surface cleanup was completed. LP

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/30/2015	Source: EPA
Date Data Arrived at EDR: 11/07/2015	Telephone: N/A
Date Made Active in Reports: 01/04/2016	Last EDR Contact: 04/05/2016
Number of Days to Update: 58	Next Scheduled EDR Contact: 04/18/2016
	Data Release Frequency: Quarterly

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Next Scheduled EDR Contact: 06/06/2016
Data Release Frequency: Quarterly

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

FINDS: Facility Index System/Facility Registry System

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 07/20/2015	Source: EPA
Date Data Arrived at EDR: 09/09/2015	Telephone: (214) 665-2200
Date Made Active in Reports: 11/03/2015	Last EDR Contact: 03/08/2016
Number of Days to Update: 55	Next Scheduled EDR Contact: 06/20/2016
	Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995	Source: EPA
Date Data Arrived at EDR: 07/03/1995	Telephone: 202-564-4104

Number of Days to Update: 35	Next Scheduled EDR Contact: 09/01/2008
	Data Release Frequency: No Update Planned

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Government Version: 08/01/2015	Source: Environmental Protection Agency
Date Data Arrived at EDR: 08/26/2015	Telephone: 202-564-8600

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

EDR PROPRIETARY RECORDS

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary faultlines, prepared in 1975 by the United State Geological Survey

1.0 INTRODUCTION

This report documents the results of a screening level noise analysis as part of the Stage 0 environmental documentation and inventory for widening and improvements to I-10 and I-12 from LA415 in West Baton Rouge Parish, across the Mississippi River to Essen Lane along both I-10 and I-12 in East Baton Rouge Parish, Louisiana. The project also includes I-110 south of Government Street. Figure 1 shows the project area.

The objectives of this study were to identify areas with likely residential noise impacts if future improvements and widening are made and identifying the impacted areas where traffic noise barriers should be studied in the Stage 1 process.

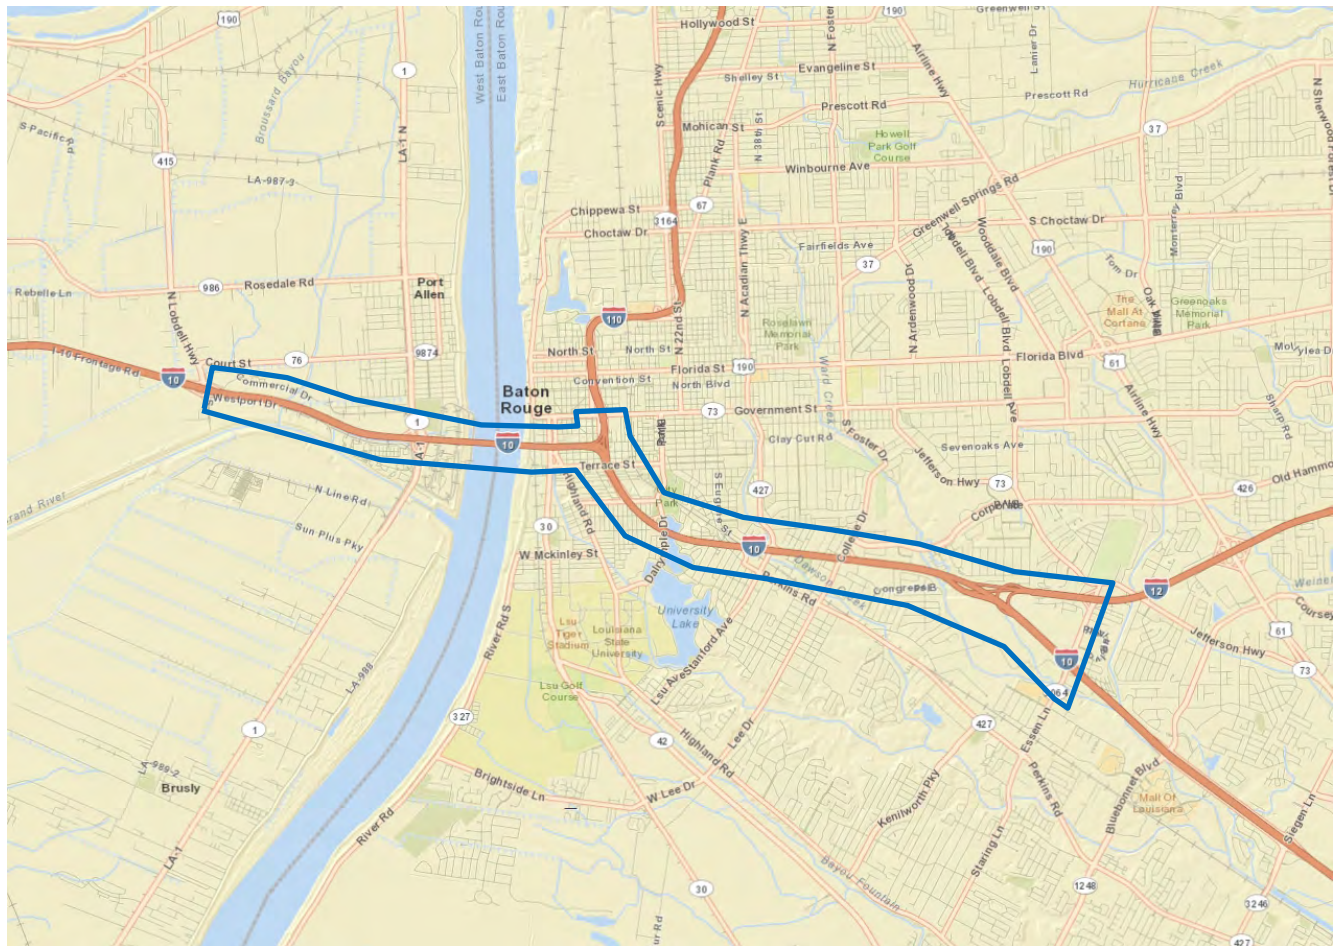

Figure 1. Project Area

2.0 SCREENING LEVEL TRAFFIC NOISE ANALYSIS

This study has been prepared using the FHWA noise standards, *Procedures for Abatement of Highway Traffic and Construction Noise*, 23 CFR 772 [1], and the Louisiana Department of Transportation and Development (DOTD) *Highway Traffic Noise Policy*, revised in 2011 [2] as guidance. The noise analysis included the following tasks:

1. Identification of noise-sensitive areas and residential receptors within 500 feet of the project;
2. Generalized predictions of potential future traffic noise levels;
3. Determination of areas with likely impacted residential receptors;
4. Evaluation of potential cost effective noise abatement for impacted areas;

Each of these analysis steps is discussed below, following a discussion of basic terminology and DOTD's criteria for determining noise impacts.

2.1 Traffic Noise Terminology

Traffic noise levels are expressed in terms of the hourly, A-weighted equivalent sound level in decibels (dBA). A sound level represents the level of the rapid air pressure fluctuations caused by sources such as traffic that are heard as noise. A decibel is a unit that relates the sound pressure of a noise to the faintest sound the young human ear can hear. The A-weighting refers to the amplification or attenuation of the different frequencies of the sound (subjectively, the pitch) to correspond to the way the human ear "hears" these frequencies.

Generally, when the sound level exceeds the mid-60 dBA range, outdoor conversation in normal tones at a distance of three feet becomes difficult. A 9-10 dBA increase in sound level is typically judged by the listener to be twice as loud as the original sound while a 9-10 dBA reduction is judged to be half as loud. Doubling the number of sources (i.e., vehicles) will increase the hourly equivalent sound level by approximately 3 dBA, which is usually the smallest change in hourly equivalent A-weighted traffic noise levels that people can detect without specifically listening for the change.

Because most environmental noise fluctuates from moment to moment, it is standard practice to condense data into a single level called the equivalent sound level (L_{eq}). The L_{eq} is a steady sound level that would contain the same amount of sound energy as the actual time-varying sound evaluated over the same time period. The L_{eq} averages the louder and quieter moments, but gives much more weight to the louder moments in the averaging. For traffic noise assessment purposes, L_{eq} is typically evaluated over the worst one-hour period and is written as $L_{eq}(h)$.

The term insertion loss (IL) is generally used to describe the reduction in $L_{eq}(h)$ at a location after a noise barrier is constructed. For example, if the $L_{eq}(h)$ at a residence before a barrier is constructed is 75 dB(A) and the $L_{eq}(h)$ after a barrier constructed is 65 dB(A), then the insertion loss would be 10 dB(A).

2.2 Criteria for Determining Impacts

Noise impacts are determined by comparing future “design year” project worst-hour $L_{eq}(h)$ values at areas of frequent human use to: (1) a set of Noise Abatement Criteria (NAC) for different land use categories, and (2) existing $L_{eq}(h)$ values. The FHWA noise standards (23 CFR 772) and DOTD’s noise policy state that when traffic noise impacts have been identified, then noise abatement should be considered.

Table 1 shows the land uses that are classified as Activity Categories A - G and the corresponding NAC.

Table 1. Noise Abatement Criteria in 23 CFR 772

<i>Activity Category</i>	<i>Activity $L_{eq}(h)$</i>	<i>Evaluation Location</i>	<i>Activity Description</i>
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B ¹	67	Exterior	Residential
C ¹	67	Exterior	Active sport areas, amphitheatres, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E ¹	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F.
F	---	---	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G	---	---	Undeveloped lands that are not permitted.

¹ Includes undeveloped lands that are permitted for this activity category.

Specifically, a receptor is impacted in either of two ways:

1. The predicted, worst hour, design year $L_{eq}(h)$ approaches or exceeds the NAC, even if there is not a substantial increase over the existing levels. "Approach" is defined by DOTD as 1 dBA less than the appropriate NAC. As an example, the NAC for Activity Category B and C land uses is 67 dBA. An impact would occur if the design year $L_{eq}(h)$ is predicted to be 66 dBA or higher at a point of frequent exterior human use for a land use in either category.
2. The predicted, worst hour, design year $L_{eq}(h)$ exceeds the existing $L_{eq}(h)$ by 10 dBA or more, even if the NAC is not approached or exceeded.

2.3 *Identification of Noise Sensitive Receptors*

A review of available electronic mapping as well as a windshield survey identified land uses within 500 feet of I-10 and I-12. The project length was broken up into thirteen analysis areas. The NAC for Activity Category B from Table 1 was applied as the criterion for determining impacts. Though Activity Category C, D and E land uses are present along the project, the residential land uses are the vast majority of impacts and thus will drive the decision on whether an analysis area is eligible for noise abatement consideration.

There are tracts of undeveloped Activity Category G lands along the project. These undeveloped lands are not noise-sensitive and have not been included in the noise analysis. However, noise impacts could occur in the future if noise-sensitive land uses are constructed near I-10.

An examination of the project area from the western project limit at LA415 east to the Mississippi River indicated no residential land uses within 500 feet of I-10. That area of the project has not been included as an analysis area.

Similarly, the area of the project along I-10 from the I-10/I-12 interchange east to Essen Lane is not shown as an analysis area. Our field review revealed very few land uses of potential impact and the density of those uses is so low that a noise barrier would not be cost effective.

Each of the analysis areas is labeled in Figures 2-5 and described below.

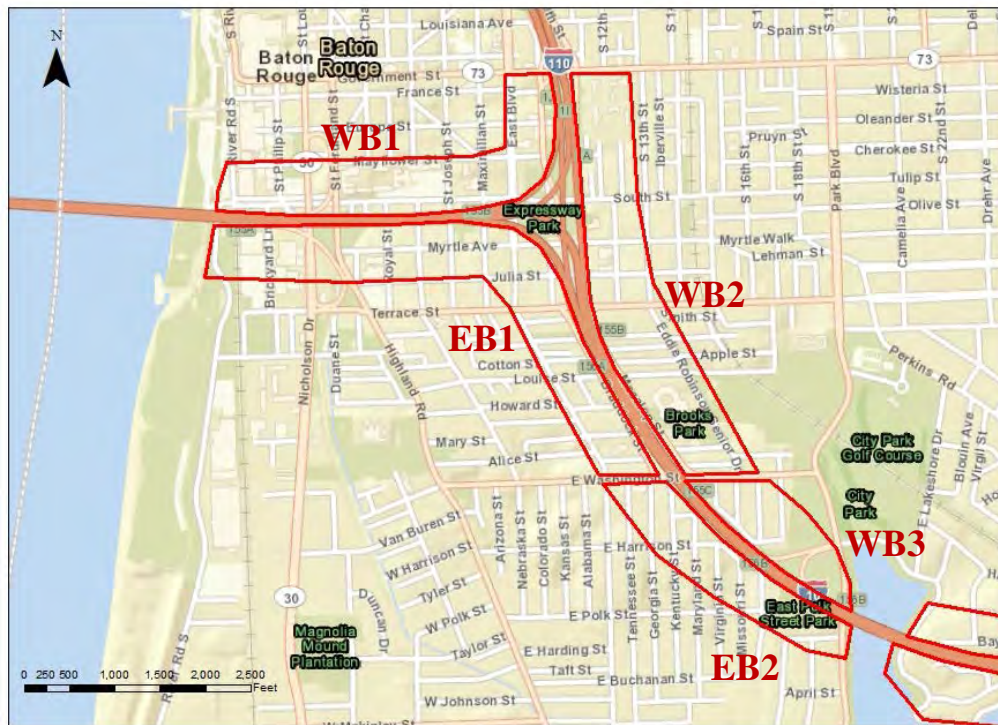

Figure 2. Analysis Areas EB1, EB2, WB1, WB2, and WB3

2.3.1 Analysis Area EB1

This analysis area is mostly mixed residential and commercial land uses with some industrial land use on its west end near the Mississippi River. The area is currently exposed to traffic noise from the elevated roadway structures of I-10 and the I-10/I-110 interchange and ramps.

2.3.2 Analysis Area EB2

The EB2 analysis area is largely residential land uses with a few commercial properties along E. Washington Street and a park adjacent to I-10. The area is currently exposed to traffic noise from I-10.

2.3.3 Analysis Area WB1

The WB1 analysis area is a mix of residential and commercial land uses along with churches, museums, governmental offices and educational uses. The area is currently exposed to traffic noise from the elevated roadway structures of I-10 and the I-10/I-110 interchange and ramps.

2.3.4 Analysis Area WB2

The WB2 analysis area is a mix of residential and commercial land uses along with churches and educational uses. The area is currently exposed to traffic noise from the elevated roadway structures of I-10 and the I-10/I-110 interchange and ramps.

2.3.4 Analysis Area WB3

The WB3 analysis area is predominantly residential land use with a few commercial properties and a church. The area is currently exposed to traffic noise from I-10.

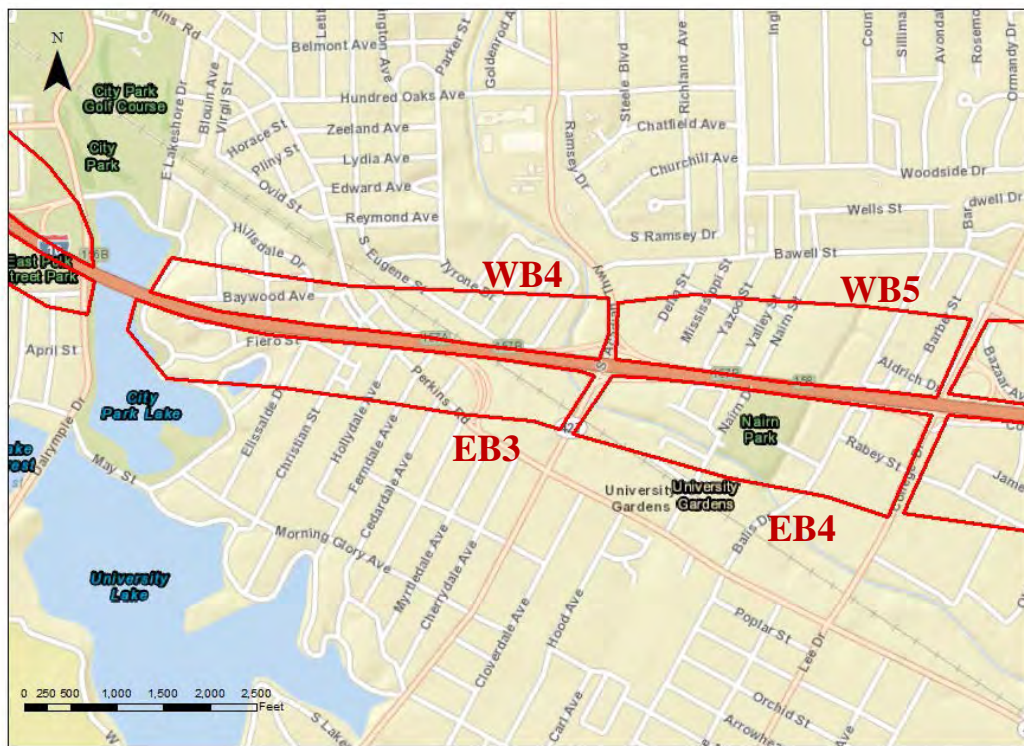

Figure 3. Analysis Areas EB3, EB4, WB4, and WB5

2.3.5 Analysis Area EB3

The EB3 analysis area is largely residential land uses with commercial land uses concentrated near Perkins Road. This area has a high concentration of apartments and condominiums between Christian Street and the east side of Perkins Road. The area is currently exposed to traffic noise from at-grade sections and elevated sections of I-10.

2.3.6 Analysis Area EB4

The EB4 analysis area is a mix of commercial and residential land uses with a park. The area is currently exposed to traffic noise from I-10 but a traffic noise barrier is in place abating traffic noise for the residences and the park.

2.3.7 Analysis Area WB4

The WB4 analysis area is largely residential land uses with commercial land uses concentrated near Perkins Road. The area is currently exposed to traffic noise from at-grade sections and elevated sections of I-10.

2.3.8 Analysis Area WB5

The WB5 analysis area is a mix of residential and commercial land uses with the commercial uses concentrated around Perkins Road. The area is currently exposed to traffic noise from I-10.

Figure 4. Analysis Areas EB5 and WB6

2.3.9 Analysis Area EB5

The EB5 analysis area is a mix of mostly commercial and hotel land uses on its west side and then transitioning to residential on its east side. The area is exposed to traffic noise from I-10 but a traffic noise barrier is in place abating traffic noise for the residences.

2.3.10 Analysis Area WB6

The WB6 analysis area is largely commercial and hotel land uses. No residential land uses were identified in this analysis area. The area is currently exposed to traffic noise from I-10.

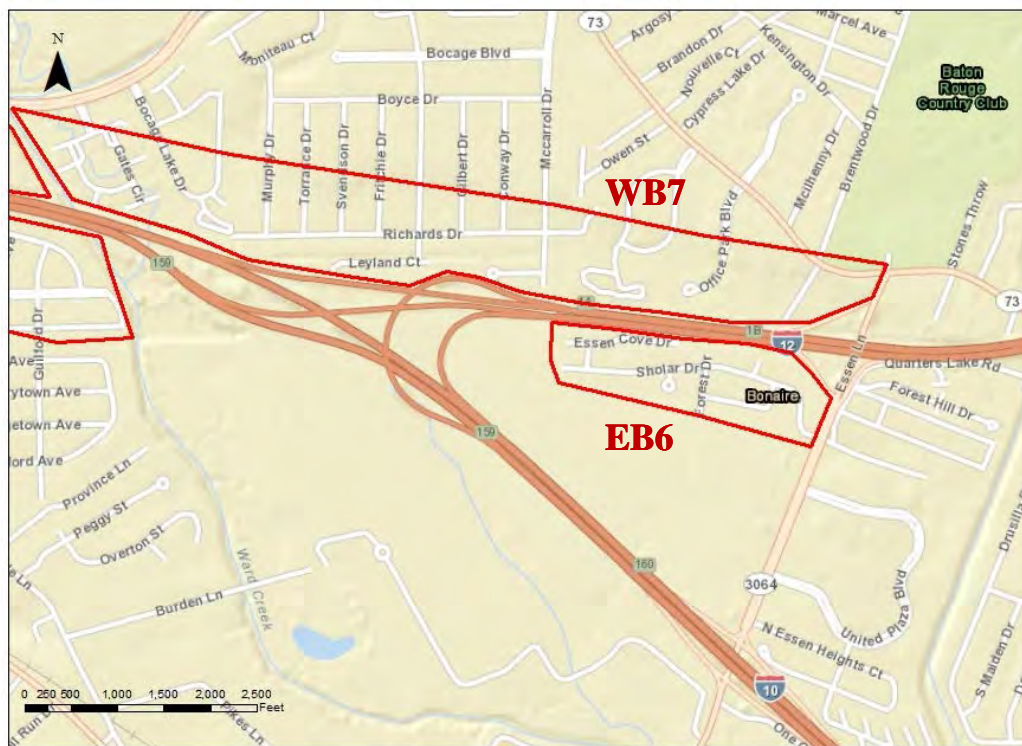

Figure 5. Analysis Areas EB6 and WB7

2.3.11 Analysis Area EB6

The EB6 analysis area is mostly residential land uses with some commercial land use concentrated on the east side of the area along Essen Lane. The area is currently exposed to traffic noise from I-10 but a traffic noise barrier is in place abating traffic noise for the residences.

2.3.12 Analysis Area WB7

The WB7 analysis area is residential land use from the western side of the analysis area east to Office Park Boulevard where the commercial land uses begin and continue to Essen Lane. The area is exposed to traffic noise from I-10 but a system of traffic noise barriers is in place abating traffic noise for the residences.

2.4 *Determination of Future One-Hour Equivalent Sound Levels*

The FHWA TNM 2.5 computer program was then used to calculate worst-hour equivalent sound levels for generalized cross sections in each noise analysis area.

The following assumptions were made as part of input for the TNM calculations for this screening analysis:

- Level of Service (LOS) C traffic volumes
- Vehicles travelling at 60 mph
- Four travel lanes in each direction of I-10/I-12/I-110

The LOS C volumes were selected as a “worst case” scenario for determining potential noise impacts. Each direction of travel was modeled as a separate TNM roadway, with the traffic divided evenly across all lanes in the same direction.

Representative noise receptors were modeled within TNM with receiver points located in the middle of the cross section in 50 foot increment distances from the edge of pavement. Predictions were made for an at-grade cross section and a 20ft elevated roadway cross section. Predictions of future $L_{eq}(h)$ indicated noise impacts out to 450-500 feet from the edge of the closest travel lane for both the at-grade cross section and the elevated roadway cross section.

Since the existing noise environment along the project is already dominated by I-10 traffic noise it is unlikely that any noise impacts will be created by the project by exceeding the existing $L_{eq}(h)$ by 10 dBA or more. For this study noise impacts were identified and noise abatement evaluated where predicted future sound levels were 66 dBA or higher.

Note: TNM noise predictions and the screening methodology employed in this study do not account for traffic noise that emanates from or reflects off the underside of an elevated bridge deck. This issue should be studied carefully and accounted for in the Stage 1 environmental process.

2.5 *Noise Abatement Evaluation*

In accordance with criteria in the DOTD noise policy, noise abatement needs to be studied first for “feasibility” and, if feasible, for “reasonableness.” Noise barriers must be both feasible and reasonable for them to be deemed likely for construction.

Feasibility includes acoustical and engineering considerations. Acoustical feasibility means that a noise barrier will provide at least a 5 dBA reduction in the one-hour equivalent sound level for at least 75% of the first-row, impacted receptors. If a barrier cannot meet this criterion, abatement is considered to not be acoustically feasible. Additionally, the noise barrier should be feasible from an engineering perspective. Engineering feasibility takes into account topography, drainage, safety, barrier height, utilities, and access and maintenance needs (which may include right-of-way considerations). If a barrier poses engineering problems, it may be judged as not feasible even if it meets the acoustical feasibility criterion, and it will not be recommended for construction.

For the purposes of this study, all analyzed potential noise barriers are assumed to be acoustically feasible. Final determinations of acoustic feasibility will be made during the Stage 1 process.

If feasible, then the barriers are assessed for reasonableness in accordance with the criteria in DOTD's noise policy. All proposed noise abatement must meet the following three criteria to be considered reasonable by DOTD. If any of the criteria is not met, noise abatement measures will not be constructed.

1. *Noise Reduction Design Goal:* At a minimum, at least one receptor must receive an 8 dBA reduction for the noise abatement system to be reasonable.
2. *Cost-Effectiveness:* If the estimated cost of constructing a noise barrier (including installation and additional necessary construction such as foundations or guardrails) divided by the number of benefited receptors (those who would receive a reduction of at least 5 dBA) is \$35,000 or less per benefited receptor, a barrier is considered to be cost-effective.
3. *Consideration and Obtaining Views of Residents and Property Owners:* The viewpoints of the affected property owners and residents are important. For those barriers found to be reasonable by the Cost-Effectiveness and Design Goal criteria above, viewpoints of the benefited receptors and affected property owners will be sought.

For the purposes of this study, the Noise Reduction Design Goal is assumed to be met for all analyzed barriers. Actual Noise Reduction Design Goal determinations will be made during the Stage 1 process. Additionally, the third criterion above cannot be determined until DOTD approved noise barrier recommendations are forwarded to the public during the Stage 1 process.

A potential noise barrier was investigated for each of the noise analysis areas with likely noise impacts. The main focus of that investigation was determining an approximate location, length and height for a potential noise barrier and the number of residences benefited by that barrier for the purpose of calculating the Cost Effectiveness criterion above. According to DOTD policy, a residence is considered benefited if it receives an insertion loss of 5 dB or greater from a noise barrier. A noise barrier is considered cost effective if the cost of the barrier per benefited residence is below \$36,000.

None of the barrier locations, lengths, or heights are precise, rather they serve to provide a baseline understanding of potential noise barriers that should be further examined in the Stage 1 process. The results documented in this study should not be construed as a commitment by DOTD to construct noise barriers in any of the described areas. That determination will be made during the Stage 1 process.

The 2011 Noise Barrier Cost Matrix, produced by DOTD and shown in Appendix B, shows a significant increase in unit cost for noise barriers over 14 feet. Our screening level traffic noise analysis predicted insertion losses of 5 dB or more out to a distance of 450-500 feet from the edge of travel lane for a barrier height of 14 feet for both the at-grade cross section and the elevated roadway cross section. All noise barriers were assumed to be 14 feet in height.

The following figures and discussion identify the potential noise barriers and areas with traffic noise impacts that should be given further analysis. Barrier locations indicated in figures are approximate and should be refined in the Stage 1 environmental process. All benefits shown in the figures are estimates of residential benefits based on the windshield survey and field review.

Additional details on the potential noise barriers are available in Appendix B.

2.5.1 Barrier EB1

This potential barrier begins on its west end just east of Highland Road and runs east and then south paralleling the eastbound lanes of I-10. The barrier continues south along the mainline lanes of I-10 and eventually ends in the vicinity of the exit lane from I-10 eastbound to E. Washington Street. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 133 residences were estimated to be benefitted. The barrier has a length of 4,970 feet and a height of 14 feet. The total area for this potential barrier is 69,580 square feet. The total estimated cost for the EB1 barrier is \$2,156,980. The estimated cost per benefitted residence for the EB1 barrier is \$16,218 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

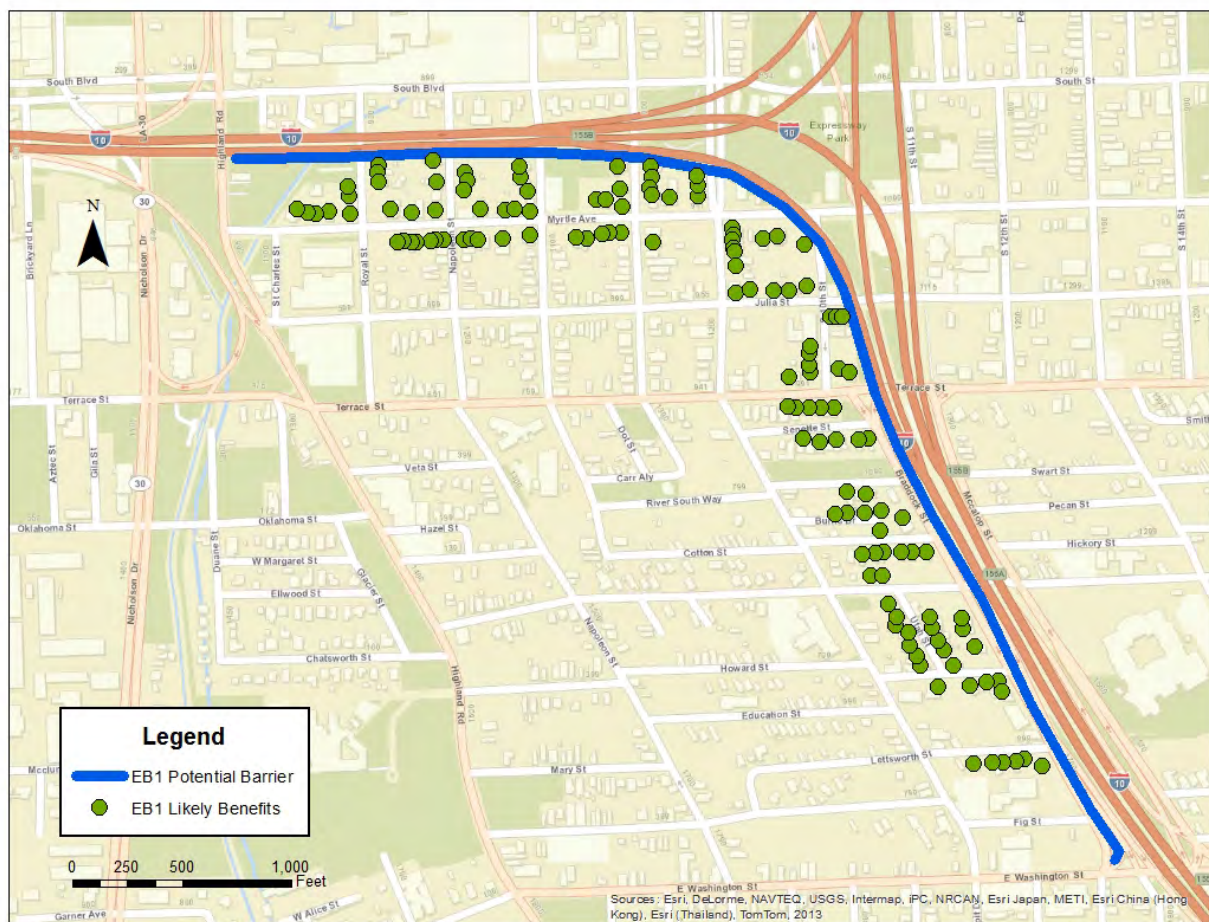

Figure 6. Potential Barrier EB1

2.5.2 Barrier EB2

Potential barrier EB2 begins on its west end north of E. Washington Street along the elevated roadway structure and runs southeast along the eastbound lanes of I-10. The barrier's south end is along the exit lane from I-10 eastbound to Dalrymple Drive. Note that the Stage 1 study should analyze an additional length of barrier along the elevated eastbound mainline of I-10 in this area. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 64 residences were estimated to be benefitted. The barrier has a length of 2,552 feet and a height of 14 feet. The total area for this potential barrier is 35,728 square feet. The total estimated cost for the EB2 barrier is \$1,286,208. The estimated cost per benefitted residence for the EB2 barrier is \$20,097 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

Figure 7. Potential Barrier EB2

2.5.3 Barrier WB1

This potential barrier begins on its north end just south of Government Street, runs south along I-110 and then turns west paralleling the ramp to westbound I-10. The barrier continues west along the mainline lanes of I-10 and eventually ends just west of Highland Road. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 55 residences were estimated to be benefitted. The barrier has a length of 3,642 feet and a height of 14 feet. The total area for this potential barrier is 50,988 square feet. The total estimated cost for the WB1 barrier is \$1,631,616. The estimated cost per benefitted residence for the WB1 barrier is \$29,666 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

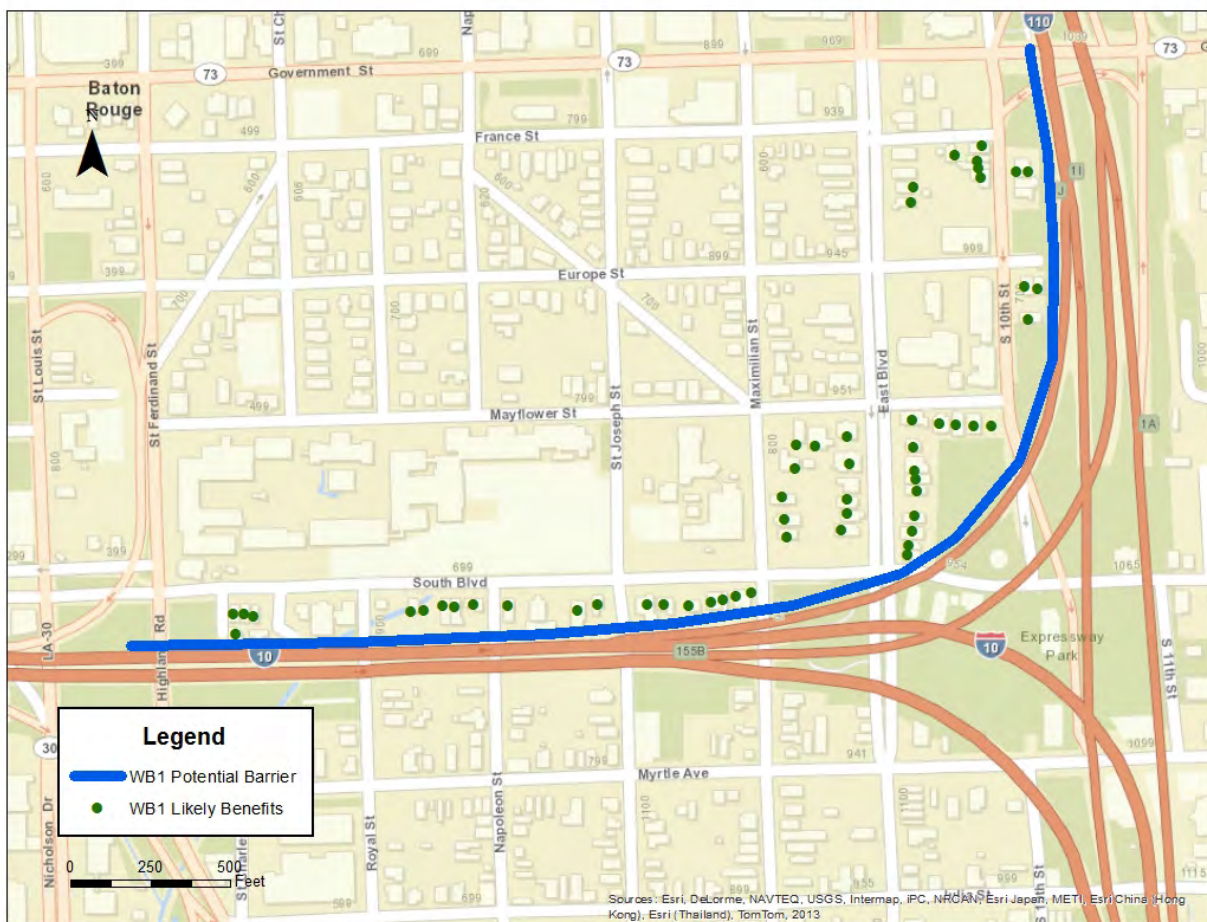

Figure 8. Potential Barrier WB1

2.5.4 Barrier WB2

Potential barrier WB2 begins on its north end along the exit ramp from I-110 to Government Street approximately 350 feet south of Government Street. From there the barrier runs south along the elevated roadway structure along I-10 eventually ending along the entrance ramp from E. Washington Street and McCalop Street to I-10 westbound near Pear Street. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 67 residences were estimated to be benefitted. The barrier has a length of 4,359 feet and a height of 14 feet. The total area for this potential barrier is 61,026 square feet. The total estimated cost for the WB2 barrier is \$1,891,806. The estimated cost per benefitted residence for the WB2 barrier is \$28,236 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

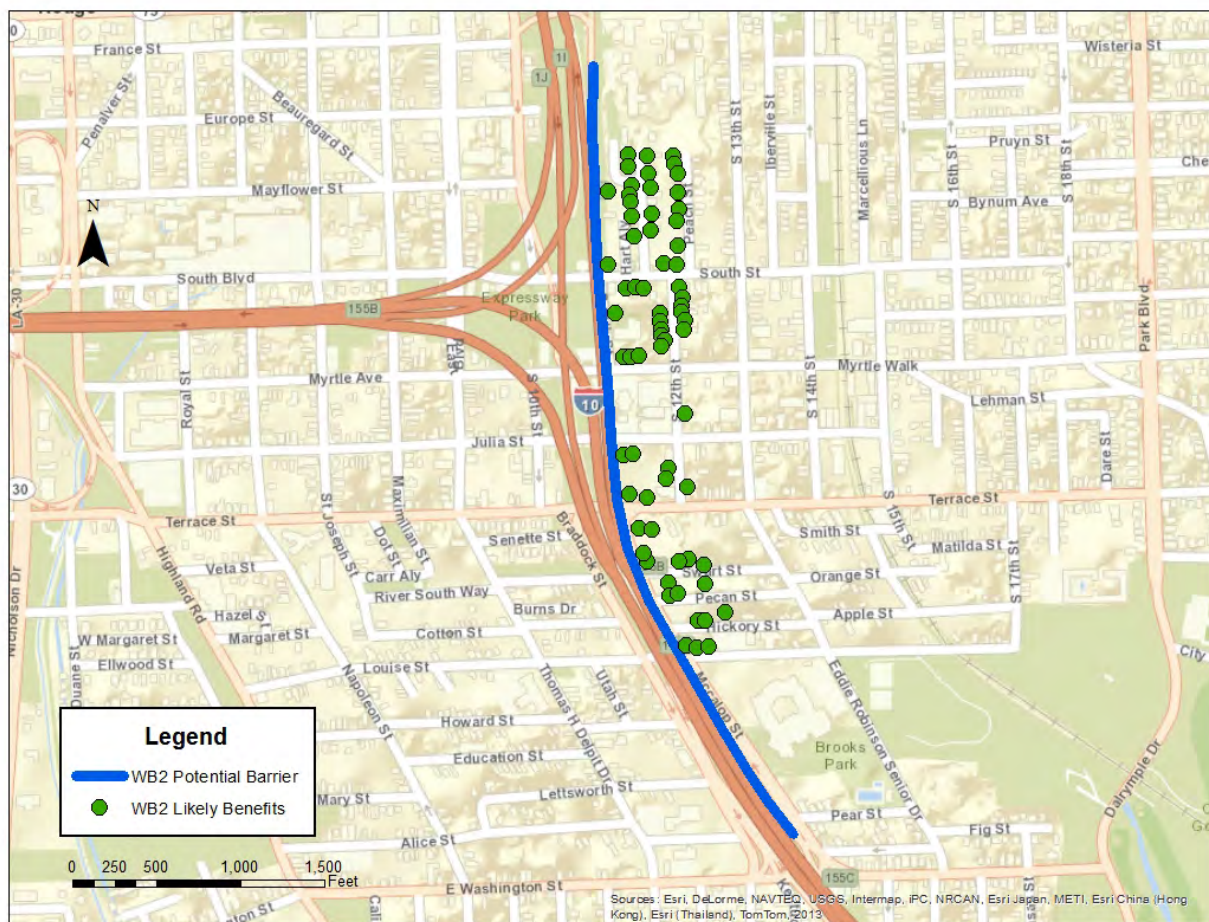

Figure 9. Potential Barrier WB2

2.5.5 Barrier WB3

This potential barrier begins on its north end just north of Pear Street along the exit ramp from I-10 westbound to McCalop Street. From that location the barrier runs southeast along the east side of I-10 and eventually following the entrance ramp to I-10 westbound from Dalrymple Drive. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 42 residences were estimated to be benefitted. The barrier has a length of 1,856 feet and a height of 14 feet. The total area for this potential barrier is 25,984 square feet. The total estimated cost for the WB3 barrier is \$1,013,376. The estimated cost per benefitted residence for the WB3 barrier is \$24,128 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

Figure 10. Potential Barrier WB3

2.5.6 Barrier EB3

Potential barrier EB3 begins on its west end approximately 150 west of the bank of City Park Lake along the elevated roadway structure. The barrier then runs east along the eastbound lanes of I-10 along the edge of shoulder until transitioning to the elevated roadway structure over Christian Street and Perkins Road ending along the exit ramp from eastbound I-10 to Perkins Road. Note that the Stage 1 study should analyze an additional length of barrier along the elevated eastbound mainline of I-10 to provide additional noise reduction at the east end of the barrier. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 102 residences were estimated to be benefitted including several apartment and condominium buildings near Christian Street, Hollydale Avenue and Perkins Road. The barrier has a length of 3,699 feet and a height of 14 feet. The total area for this potential barrier is 51,786 square feet. The total estimated cost for the EB3 barrier is \$1,657,152. The estimated cost per benefitted residence for the EB3 barrier is \$16,247 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

Figure 11. Potential Barrier EB3

2.5.7 Barrier WB4A

This potential barrier begins on its west end approximately 60 feet west of the shore of City Park Lake along the westbound lanes of I-10. From that location the barrier runs east along the north side of I-10 and eventually ends at the western end of the elevated roadway structure over Perkins Road. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 28 residences were estimated to be benefitted. The barrier has a length of 2,195 feet and a height of 14 feet. The total area for this potential barrier is 30,730 square feet. The total estimated cost for the WB4A barrier is \$1,137,010. The estimated cost per benefitted residence for the WB4A barrier is \$40,608 which is above the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy. However, since this area is relatively close to the DOTD cost effectiveness criterion it should be analyzed further during the Stage 1 process.

Figure 12. Potential Barrier WB4A

2.5.8 Barrier WB4B

This potential barrier begins on its west end along mainline I-10 westbound just east of the merge point of the Perkins Road entrance ramp to I-10 westbound. From there the barrier runs east along the westbound lanes of I-10 and eventually ends approximately 400 feet west of S. Acadian Thruway along the entrance ramp from S. Acadian Thruway to I-10 westbound. Note that the Stage 1 study should analyze an additional length of barrier along the elevated westbound mainline of I-10 to provide additional or possibly more effective noise reduction than the portion of the barrier along the entrance ramp from S. Acadian Thruway. Residential benefits were counted back to a distance of approximately 500 feet for this barrier. A total of 38 residences were estimated to be benefitted. The barrier has a length of 1,813 feet and a height of 14 feet. The total area for this potential barrier is 25,382 square feet. The total estimated cost for the WB4B barrier is \$989,898. The estimated cost per benefitted residence for the WB4B barrier is \$26,050 which is below the \$36,000 cost effectiveness criterion set in DOTD's Noise Policy.

Figure 13. Potential Barrier WB4B

Table 2. Summary of Potential Noise Barriers

Barrier Name	Estimated Barrier Area (sf)	Estimated Number of Benefitted Residences	Estimated Cost
EB1	69,580	133	\$2,156,980
EB2	35,728	64	\$1,286,208
WB1	50,988	55	\$1,631,616
WB2	61,026	67	\$1,891,806
WB3	25,984	42	\$1,013,376
EB3	51,786	102	\$1,657,152
WB4A	30,730	28	\$1,137,010
WB4B	25,382	38	\$989,898
<i>TOTAL</i>	351,204	529	\$11,764,046

2.6 Existing Noise Barriers and Possible Barrier Enhancements

During the field review, areas that have existing noise barriers were identified within the project limits. Brief, handheld noise measurements behind some of these barriers indicated that current traffic noise levels behind the noise barriers were close to or above the 66 dBA NAC level indicating that there could be noise impacts for residential land uses at those locations.

Figures 14-18 show the locations of the existing barriers. Areas that have existing barriers where noise impacts might occur with future improvements to I-10 are shown in red and labeled so that any potential barrier enhancements can be addressed in the Stage 1 process. This report does not provide cost estimates for potential barrier enhancement solutions to the existing noise barriers where future impacts might occur.

INTRODUCTION

This document contains the Louisiana Department of Transportation and Development's (DOTD) policy on highway traffic noise. This policy describes the implementation of the requirements of the Federal Highway Administration (FHWA) noise regulations for Federal-aid projects found in 23 Code of Federal Regulations Part 772 (23 CFR Part 772).¹ DOTD developed this policy in accordance with FHWA regulations and guidance, and FHWA reviewed and approved this policy for implementation.

In the 1972 Federal-aid Highway Act, Congress required FHWA to develop a noise standard for new Federal-aid highway projects. In accordance with 23 United States Code section 109(i) (23 USC 109(i)), FHWA promulgated noise regulations which applied to Federal-aid projects. In June 1995, FHWA mandated that state transportation agencies adopt a written Highway Traffic Noise Policy consistent with the regulations and their June 1995 guidance. DOTD complied, with its first written policy approved by FHWA in August 1996. Since its initial approval, the DOTD highway traffic noise policy has been revised three times, in 1997, 2004 and 2009. Each revision required FHWA review and approval prior to implementation. On July 13, 2010, FHWA published their new noise regulations in the Federal Register² and mandated that state transportation agencies rewrite their noise policies to be consistent with the new regulations. The states were given until January 2011 to submit proposed policies for FHWA review. To assist states in rewriting their policies, FHWA published guidance dated June 2010 and revised January 2011 which can be found on FHWA's web site.³ The effective date of the new regulations is July 13, 2011.

The policy herein contains information on how highway traffic noise impacts are defined, how noise abatement is evaluated, and how noise abatement decisions are made in Louisiana. **This policy as written assumes that the noise analyst is familiar with the provisions of the Federal regulation on which this policy is based.** If you need further information regarding the policy, contact the DOTD Environmental Section at (225) 242-4502.

PURPOSE

The purpose of this written policy is to outline DOTD's policy and procedures for compliance with the FHWA Noise regulations found at 23 CFR 772.

¹ Access CFR regulations from <http://www.gpoaccess.gov/cfr/retrieve.html>

² Access Federal Register, Vol. 75, page 39820 from FR Main page at <http://www.gpoaccess.gov/fr/index.html>

³ Access FHWA noise guidance, regulations, and related material from <http://www.fhwa.dot.gov/environment/noise/>

DEFINITIONS

Reference is made to the definitions contained in the regulations (23 CFR 772.5). Defined below are some of the terms specifically referenced in the policy or which require additional refinement.

Benefited Receptor - a recipient of an abatement measure, whether impacted or not, receiving 5 dBA or more reduction in the noise level as a result of the proposed abatement.

Common Noise Environment – a group of receptors within the same Activity Category in Table 1 that are exposed to similar noise sources and levels; traffic volumes, traffic mix, and speed; and topographic features.

Date of Public Knowledge - the date of approval of the Record of Decision, Finding of No Significant Impact, or Categorical Exclusion. The date of public knowledge is the date at which the DOTD will no longer be responsible for providing noise abatement for new development which occurs adjacent to the proposed project. Provision of such abatement measures becomes the responsibility of the local communities or private developers.

Design Year – the future year used to estimate the probable traffic volume for which a highway is designed. The design year will normally be 20 years from the projected start of project construction.

Existing Noise Levels – the worst noise hour, resulting from the natural and mechanical sources and human activity, usually present in a particular area.

Leq – the equivalent steady-state sound level which in a stated period of time contains the same acoustic energy as a time-varying sound level during the same period.

Leq(h) – the hourly value of Leq.

Multifamily Dwelling – A residential structure containing more than one residence. Each residence in a multifamily dwelling shall be counted as one receptor when determining impacted and benefited receptors.

Noise Reduction Design Goal – the optimum desired noise reduction determined from calculating the difference between future build noise levels with abatement to future build noise levels without abatement. The noise reduction design goal in Louisiana is 8 dBA.

Permitted – A definite commitment to develop land with an approved specific design of land use activities as evidenced by the issuance of a building permit.

Property Owner – an individual or group of individuals that hold a title, deed, or other legal documentation of ownership of a property or a residence.

Receptor – A discrete or representative location of a noise sensitive area(s), for any of the land uses listed in Table 1.

Residence – a dwelling unit. Either a single family residence or each dwelling unit in a multifamily dwelling.

Statement of Likelihood – A statement provided in an environmental document based on the feasibility and reasonableness analysis at the time the document is being approved.

Traffic Noise Impacts – design year build condition noise levels that *approach* or exceed the FHWA Noise Abatement Criteria for the future build condition, or design year build condition noise levels that exceed the existing noise levels by 10 dBA. (*Approach* is defined as 1 dBA less than the FHWA Noise Abatement Criteria.)

Type I Project –

- (1) The construction of a highway on new location; or
- (2) The physical alteration of an existing highway where there is either:
 - (a) Substantial Horizontal Alteration (a project that halves the distance between the traffic noise source and the closest receptor between the existing condition to the future build condition), or
 - (b) Substantial Vertical Alteration (a project that removes shielding therefore exposing the line-of-sight between the receptor and the traffic noise source by altering the vertical alignment of the highway or by altering the topography); or
- (3) The addition of a through-traffic lane. This includes the addition of a through-traffic lane that functions as a HOV, HOT, bus, or truck climbing lane; or
- (4) The addition of an auxiliary lane, except for when the auxiliary lane is a turn lane; or
- (5) The addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange; or
- (6) Restriping existing pavement for the purpose of adding a through-traffic lane or an auxiliary lane; or
- (7) The addition of a new or substantial alteration of a weight station, rest stop, ride-share lot or toll plaza.

*Note that if a project is determined to be a Type I project, then the entire project area as defined in the environmental document is a Type I project.

Type II Project – a proposed project to provide noise abatement on an existing highway. DOTD does not have a Type II program.

Type III Project – a proposed project that does not meet the classification of a Type I or Type II project. Type III projects do not require a noise analysis.

APPLICABILITY

This policy applies to all Federal highway projects in the State of Louisiana; that is, any projects that receive Federal-aid funds or are otherwise subject to FHWA approval.

This policy also applies to the construction of new control of access highways that are funded through DOTD with no FHWA involvement.

Type II programs to provide noise abatement along existing highways are voluntary. DOTD does not have a Type II program; therefore, DOTD will not consider Type II projects.

DOTD will consider and construct barriers when sufficient funds (Federal or State) are appropriated by either State or Federal legislature specific to the construction of a barrier. These legislative mandated barriers may or may not be part of a Type I project. These barriers will be designed in accordance with the legislation as to location, height, and other parameters. If the design parameters are not specified in the legislation, the barrier will be designed to achieve a reasonable noise reduction in accordance with this policy.

This policy shall not prohibit the application of visual screens or security fences. Visual screens and security fences are not eligible for Federal-aid funding as noise abatement.

TRAFFIC NOISE ANALYSIS

The traffic noise analysis will include the steps listed below for each alternative under detailed study. Note that if any segment or component of an alternative meets the definition of a Type I project, then the entire alternative is considered to be Type I and is subject to the noise analysis requirements below.

1. **Identification of Existing Land Uses Affected by Noise:** The following types of activities and land uses affected by noise from the highway will be identified for analysis:
 - a. Category A: Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose;
 - b. Category B: residential;
 - c. Category C: active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings;
 - d. Category D: auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios;
 - e. Category E: hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F;
 - f. Category F: agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing; and
 - g. Category G: undeveloped lands that are not permitted.

Justification for the designation of lands as Category A must be submitted to FHWA on a case-by-case basis for concurrence. Justifications will be submitted through the FHWA Division Office to FHWA Headquarters.

2. **Determination of Existing Noise Levels:** The determination of existing noise levels will be made utilizing field measurements of actual noise levels. A log will be kept noting the time of day, meteorological conditions, calibration results, and any unusual ambient noise sources experienced during each measurement.

Noise measurements will be taken utilizing ANSI Type 1 or Type 2 Sound Level Meters used in accordance with the manufacturer's operations manual. Meters are to be calibrated before and after each measurement. Meters should have valid factory calibration certification. Measurements should be done in accordance with the FHWA publication entitled, "Measurement of Highway – Related Noise," dated May 1996.⁴

Noise measurements will be taken in time intervals no shorter than 15 minutes and no longer than one hour unless alternate intervals are given prior approval by DOTD.

Actual traffic counts will be made during each field measurement. These traffic counts will be categorized according to the following vehicle classes:

Automobiles (A) – all vehicles with two axles and four wheels designed primarily for transportation of nine or less passengers or transportation of cargo.

Medium Trucks (MT) – all vehicles with two axles and six wheels designed for the transportation of cargo.

Heavy Trucks (HT) – all vehicles having three or more axles designed for the transportation of cargo.

Buses (B) – all vehicles designed to carry more than nine passengers.

Motorcycles (M) – all vehicles with two or three wheels and an open-air driver/passenger compartment.

Sites selected for field measurements will receive prior approval of DOTD. These sites will represent noise sensitive receptors in each Activity Category which are likely to be affected by the project. Sites outside of the immediate vicinity of the project may also be chosen to determine the ambient noise levels unaffected by the roadway. For proposed highways on new alignments where no highway currently exists, measurements must be taken at representative receptor locations. Unless specifically approved by DOTD, field measurements will be taken to represent exterior activities only.

Field measurements will be taken at approved sites at peak and off-peak times. Peak hour noise levels will be the hour with the highest noise levels, not necessarily the hour with the highest traffic volumes.

Upon the consent of the Environmental Engineer Administrator, existing noise levels may be determined by utilizing other methodology, including computer models consistent with the current FHWA highway traffic noise prediction model. Traffic characteristics, data, selection of receptor locations, and other input parameters utilized will be at the discretion of DOTD.

⁴ Located on web at <http://www.fhwa.dot.gov/environment/noise/measurement/measure.cfm>

3. **Prediction of Traffic Noise Levels:** Any traffic noise prediction methodology is approved for use in any traffic noise analysis required by this policy if the methodology used at the time the noise study is consistent with the requirements of 23 CFR 772.9.⁵

Report predicted noise levels in the noise report and related documents in the same format as reported by the model used.⁶

To validate model results, it is necessary to compare the noise levels measured in the field to the noise levels predicted by the model using the roadway parameters and traffic data collected in the field. If the modeled results are within 3 dBA of the measured noise levels, no further action is required, and the model can be used to determine future noise levels. If the modeled results are not within 3 dBA of the measured noise levels, then further investigation is warranted into the reason(s) for the discrepancy prior to using the model to determine future noise levels.

In predicting noise levels and assessing noise impacts, traffic characteristics that will yield the worst hourly traffic noise impact on a regular basis for the design year will be used. The period with the highest sound levels may not be at the peak traffic hour but instead, during some period when traffic volumes are lower but the truck mix or vehicle speeds are higher.

Future noise levels will be based on modeling results utilizing data for the design year. This data, including traffic volumes, composition and speed, other reasonably foreseeable development, and the implementation of other transportation projects, will be based on accepted engineering practice and local planning assumptions.

4. **Determination of Traffic Noise Impacts:** Traffic noise impacts occur when the future (predicted, design year, build condition) noise levels *approach or exceed* the FHWA Noise Abatement Criteria, or when the future (predicted, design year, build condition) noise levels exceed the existing noise levels at any sensitive receptor by 10 dBA. FHWA requires that the States define *approach* as at least 1 dBA below their Noise Abatement Criteria.

⁵ The approved model in effect on July 13, 2011, the effective date of the regulations, is FHWA TNM version 2.5. When running the TNM 2.5 model, average pavement type must be used for prediction of future noise levels unless FHWA approves use of another type.

⁶ The current approved model, TNM, reports results in tenths, a decimal format (##.#).

FHWA Noise Abatement Criteria
Hourly A-weighted Sound Level decibels (dBA)

ACTIVITY CATEGORY	ACTIVITY LEQ (H)	EVALUATION LOCATION	ACTIVITY DESCRIPTION	IN LOUISIANA, IMPACT OCCURS WHEN NOISE LEVEL <u>IS EQUAL TO OR GREATER THAN</u> THE VALUES BELOW*
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.	56
B	67	Exterior	Residential (includes undeveloped lands permitted for residential).	66
C	67	Exterior	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings. (Includes undeveloped lands permitted for these activities).	66
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.	51
E	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F. (Includes undeveloped lands permitted for these activities).	71
F	-----	-----	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.	n/a
G	-----	-----	Undeveloped lands that are not permitted.	n/a

*These values are consistent with the FHWA's requirement for consideration of traffic noise impacts 1 dBA below their noise abatement criteria.

The noise analysis must include analysis for each type of receptor present in the study area. Noise contour lines shall not be used to determine noise impacts, but noise contour lines can be used for project alternative screening or for land use planning purposes.

In determining and abating traffic noise impacts, primary consideration is to be given to exterior areas of frequent human use. Examples of possible receptor locations for residential receivers are patios, courtyards, front or back yard, pool areas, etc. Generally, the receptor location which lies between the noise source and the receiver is chosen as the location to model. If the circumstances of a particular receiver are atypical, contact the DOTD Environmental Section Coordinator for guidance.

In determining the number of receptors impacted/benefited, the number will include all dwelling units (i.e., owner-occupied, rental units, mobile homes, etc.). Each unit in a multifamily building is counted as one receptor.

For hotels, motels, offices, and other developed lands, receptor locations will be sited at outdoor areas of frequent human use such as patios, courtyards, pool areas, locations of outdoor seating, etc.

For parks and recreational areas, model each designated use area as a receptor location. For example, the park may have ball fields, basketball courts, playground equipment, tennis courts, picnic area, pool, etc. Each of these specific activity areas would be modeled to determine noise impact at each of these locations.

In those situations where there are no exterior activities to be affected by the traffic noise, or where exterior activities are far from or physically shielded from the roadway in a manner that prevents an impact on exterior activities, the interior criterion, Activity Category D, shall be used as the basis of determining noise impacts. An indoor analysis shall only be done after exhausting all outdoor analysis options. Interior noise level predictions may be estimated by using the information in Table 6 of FHWA's guidance document entitled, "Highway Traffic Noise: Analysis and Abatement Guidance," dated June 2010 and revised January 2011.⁷

When applying the interior criterion, consideration is given to the impact and abatement of interior rooms facing the roadway that are occupied frequently with a use that would benefit from a reduction in noise. For example, a classroom, prayer room, or meeting room would benefit from a reduction in noise, but a storage room or boiler room would not. When determining the cost for reasonableness, one building is one receptor, although multiple rooms may be insulated or provided noise reduction windows.

For Category F, no highway noise analysis is required under 23 CFR 772.

For Category G, if the undeveloped land is not permitted for development by the date of public knowledge, the noise levels are determined in accordance with 23 CFR 772.17(a) and results are documented in the environmental document.

⁷ On-line guidance available at FHWA website,
http://www.fhwa.dot.gov/environment/noise/regulations_and_guidance/analysis_and_abatement_guidance/

5. **Evaluation of Noise Abatement:** When traffic noise impacts are identified, noise abatement shall be considered and evaluated for *feasibility* and *reasonableness*. Traffic noise impacts will be determined and alternative noise abatement measures analyzed by giving weight to the benefits and cost of abatement, and to the overall social, economic and environmental impacts.

In abating traffic noise impacts, primary consideration is given to exterior areas where frequent human use occurs and a lowered noise level would be of benefit.

The noise abatement measures listed below may be incorporated into Type I Federal or Federal-aid projects to reduce traffic noise impacts.

- (1) Construction of noise barriers, including acquisition of property rights, either within or outside the highway right-of-way. Landscaping is not a viable noise barrier;
- (2) Traffic management measures (e.g., traffic control devices and signing for prohibition of certain vehicle types, time-use restrictions for certain vehicle types, modified speed limits and exclusive lane designations);
- (3) Alteration of horizontal and vertical alignments;
- (4) Acquisition of property rights (predominantly unimproved property) to serve as a buffer zone to preempt development which would be adversely impacted by traffic noise;
- (5) Noise insulation of Activity Category D land use facilities listed in Table 1. Post-installation maintenance and operational costs for noise insulation are not eligible for Federal-aid funding.

Feasibility:

For a noise barrier to be considered acoustically feasible, 75% of the first row of impacted receptors adjacent to the barrier must achieve at least a 5 dBA reduction in highway traffic noise.

Other feasibility factors that will be considered are safety, barrier height, topography, drainage, utilities, maintenance of the abatement measure, and access to adjacent properties.

DOTD will not build noise barriers that it considers unsafe to the traveling public or adjacent properties. Topography and drainage may impact the design of the barrier or make the barrier unfeasible to construct. Utilities may render a barrier unfeasible when a conflict between the utility and barrier exists and the utility cannot be moved or cannot be moved without creating other insurmountable problems. (Note that the cost to relocate a utility will be added to the cost of the barrier when the relocation is necessary for the construction of the barrier. If this relocation cost is large, the barrier, although feasible, may become unreasonable due to cost.) DOTD must be able to access the barrier for maintenance purposes. If access cannot be obtained, the barrier is unfeasible. When access to adjacent properties must be maintained, a barrier may be unfeasible if it cannot be designed to provide the needed access. Noise barriers

that block existing driveways are considered unfeasible; however, there may be situations whereby the property owners agree in writing to forfeit their access eliminating this concern. Situations may arise whereby access is needed for seasonal activities such as maintenance or management of adjacent properties. These situations will be considered on case by case basis.

Noise barriers on bridges are limited to a maximum height of 14 feet, measured from top of noise barrier to bridge slab. Costs associated with mounting the barrier to the bridge, including the cost to modify the bridge structure to support the barrier, will be added to the cost of the barrier for determining reasonableness.

Reasonableness:

For abatement measure to be considered reasonable all of the following three criteria must be met: (a) achievement of the noise reduction design goal, (b) cost effectiveness, and (c) concurrence of benefited receptors.

- (a) Noise Reduction Design Goal: When noise abatement measures are being considered, every effort will be made to obtain a substantial noise reduction of at least 8 dBA. At a minimum, at least one receptor must receive an 8 dBA reduction for the noise abatement system to be reasonable. For noise barriers meeting the abovementioned criteria, the height and length of the barrier will be optimized using the cost/benefited receptor ratio.
- (b) Cost Effectiveness: The cost estimate of the noise abatement measure (including but not limited to the costs of real estate acquisition, construction servitude or utility relocation) should be equal to or less than \$35,000 per benefited receptor. The unit cost used to estimate the cost of likely barriers will be updated regularly (at least every five years) and published on DOTD's web site. *The final analysis regarding cost effectiveness will occur during design when more detail information is available regarding the cost of the barrier system, and*
- (c) Consideration of Viewpoints: As part of the NEPA public involvement process, viewpoints from the community, including benefited receptors, will be solicited for all aspects of the project, including noise impacts and abatement. Public Involvement will be tailored to the project. If no relevant objections to the proposed noise abatement are made at this level of public involvement, this criterion is deemed met and abatement considered reasonable from the viewpoint of benefited receptors. If relevant objections are identified, a follow-up solicitation will occur with property owners and residents of the benefited receptors. The abatement measure will be considered reasonable from the viewpoint of benefitting receptors if 50% or more of the responses received are positive. *Follow-up coordination with benefited receptors may occur during the design stage when more detail information is available regarding barrier design.*

Follow-up Coordination with Benefited Receptors during Final Design

For noise barriers, the most common type of abatement, the Department will contact benefited receptors when the barrier design changes substantially from what was

presented in the NEPA document. The abatement measure will be considered reasonable from the viewpoint of benefitting receptors if 50% or more of the responses received are positive.

To ascertain desires, property owners and residents may be invited to attend a meeting specifically to discuss the proposed barrier, or they may be asked to complete a survey (paper, electronic, phone, etc.). Contact may be made through a variety of means such as in person, letters, flyers left at the receptor site, public notices, web sites, phone calls, emails or other reliable means or combination of means. Names and/or addresses may be obtained from the tax assessor's roll, clerk of court records, neighborhood associations, local government databases, reliable internet sources, or other reliable sources or combination of sources. Those who do not respond as requested will be deemed as not interested in the barrier. DOTD will give more weight to the desire of the property owner than to the desire of the lessee. (When conflicting responses are received, DOTD will consider the property owner's response over that of the lessee's.)

The criteria above must be met collectively for a noise abatement measure to be deemed reasonable. Failure to achieve all criteria collectively will result in the noise abatement measure being deemed not reasonable. **During stage 1 of project development (NEPA stage), the analysis will identify noise abatement measures that are likely to be incorporated into the project's design. The final determination of any proposed noise abatement measure will be made during the design stage.** During the design stage, only abatement measures identified in stage 1 as likely will be reevaluated for reasonableness. If the decision to provide an abatement measure changes during final design, the Department will inform the public.

The following optional factors are considered when determining justification for additional cost allowances to an already determined reasonable barrier:

- date of development (implementation requires public outreach),
Favorable consideration will be given to residential developments that existed prior to the initial construction of the highway. (This factor applies to projects along existing highways and not to new alignments.)

Residential development existed prior to the original construction of the highway	Added to Reasonableness Criteria (b)
No	\$0
Yes	\$2,000

- changes between existing and future build-conditions,
Favorable consideration will be given to impacted receptors that experience future build noise levels that are 30 dBA more than future no-build noise levels.

Incremental Increase in Noise Level Between the Future No-build and the Future Build Noise Levels Before Noise Abatement	Added to Reasonableness Criteria (b)
Less than 30 dBA	\$0
30 dBA or greater	\$2,000

- exposure to higher absolute highway traffic noise levels, Favorable consideration will be given to impacted receptors that have predicted future noise levels above 76 dBA

Predicted Future Build Noise Level Before Noise Abatement	Added to Reasonableness Criteria (b)
66-75 dBA	\$0
76-79 dBA	\$1,000
80 dBA or greater	\$2,000

and

- use of noise compatible planning concepts by the local government, Favorable consideration will be given to areas that have noise compatible (relevant to highway noise) zoning requirements in place that include the project area.

Noise compatible zoning in place for study area	Added to Reasonableness Criteria (b)
No	\$0
Yes, in place for 1 to 2 years	\$1,000
Yes, in place for 2 or more years	\$1,500

DOCUMENTATION

The noise study report will document the results of the noise study. This report may be a standalone document incorporated into the NEPA document by reference, or it may be included in the appendix of the NEPA document.

Before adoption of a Final Environmental Impact Statement, Finding of No Significant Impact, or Categorical Exclusion, for Federal-aid projects, the DOTD will identify noise abatement measures which

are both reasonable and feasible and likely to be incorporated in the project. The statement of likelihood included in the environmental document will give the locations and physical description of the noise abatement measures as well as explain that the final recommendation will be determined during final design with input from benefited receptors. The DOTD will also identify noise impacts for which no apparent solution is available.

MISCELLANEOUS PROVISIONS

Third party funding is not allowed if the funding is required to make the abatement measure feasible or reasonable. Third party funding is acceptable to make functional enhancements such as absorptive treatment, access doors, or aesthetic enhancements to a noise abatement measure already determined to be both reasonable and feasible.

DOTD allows the use of either absorptive or reflective barriers. DOTD generally assumes reflective barriers in its noise analyses. This does not preclude the use of absorptive barriers or absorptive treatments. For example, a contractor may be given the option of using any barrier system on the Qualified Products List (QPL)⁸ for construction. The QPL includes both reflective and absorptive systems. Therefore, the contract may choose either an absorptive or a reflective system as long as the system is on the QPL. Using an absorptive barrier when a reflective barrier was assumed for modeling purposes is not considered a substantial change in design for the purposes of soliciting viewpoints of benefited receptors. Note that decorative features often requested for visual enhancements may preclude use of absorptive treatments or some QPL barrier systems. If separate absorptive treatments are requested, the cost for the treatment will be added to the cost of the barrier system to determine reasonableness. If the additional absorptive treatment increases the cost above the maximum cost/benefited receptor value, it will not be considered for implementation unless the optional reasonableness factors apply. Use of absorptive barriers or treatments on a project is discretionary.

Cost averaging is used when a common noise environment exists. Common noise environments occur when the traffic mix and speeds are the same. For instance, a common noise environment could occur along a road segment between interchanges on a controlled access highway if the traffic speed is constant. Application requires that no single common noise environment exceeds \$70,000/benefited receptor and that collectively all common noise environments being averaged do not exceed \$35,000/benefited receptor.

Information for Local Officials: In an effort to prevent future traffic noise impacts on currently undeveloped lands, DOTD will inform local officials, within whose jurisdiction the highway project is located, of the best estimation of future noise levels for both developed and undeveloped lands or properties in the immediate vicinity of the project and information that may be useful to local communities to limit future land development to that which will be compatible with anticipated highway noise levels.

A copy of the environmental document (with included noise study) and/or noise study report (if one is prepared) will be provided to local officials upon approval of the environmental document. Local

⁸ QPL 69, Noise Reduction Systems (Noise Barriers), can be found at <http://www.dotd.la.gov/highways/construction/lab/qpl/tableofcontents.shtml>

officials or agencies, which may have jurisdiction, include the Mayor's office, city/town/parish council, parish police jury, and metropolitan planning organization, as applicable.

Construction Noise: The following general steps are to be performed for all Type I projects:

- a. Identify land uses or activities that may be affected by noise from the construction of the project. The identification is to be performed during the project development studies.
- b. Determine the measures that are needed in the plans and specifications to minimize or eliminate adverse construction noise impacts to the community including alternate designs to keep noise levels to a minimum (e.g. the use of drilled shafts vs. driven piles in noise sensitive areas).⁹ This determination will include a weighing of benefits achieved and the overall adverse social, economic, and environmental effects and costs of abatement measures.
- c. Incorporate the needed abatement measures in the plans and specifications, as appropriate.

When practicable, DOTD will construct any permanent noise abatement measures as the first phase of a highway construction project to abate construction noise impacts of subsequent phases of the same project.

Revision: DOTD may revise this policy as necessary to keep current with the state-of-the-art technology, legislation, regulation, and guidance, as well as construction cost indices in the fields of highway traffic noise prediction, impact, and abatement.

The unit cost used in the noise analysis for determining reasonableness of noise abatement measures will be updated regularly at least every five years. It is the responsibility of the analyst to ensure that they are using the correct unit cost. Contact the DOTD Environmental Coordinator for more information.

Revisions to this policy affecting Federal or Federal-aid projects must be concurred with by the FHWA prior to adoption.

DOTD and FHWA are not responsible for notification of revisions to this policy. Inquiries as to the latest revision that may be applicable should be made in writing to:

Environmental Engineer Administrator
Louisiana Department of Transportation and Development
Post Office Box 94245
Baton Rouge, Louisiana 70804-9245

Implementation Plan: This policy will become effective July 13, 2011. It will apply to all projects started on or after the above effective date, and to all projects currently being evaluated pursuant to NEPA that do not have a completed noise study. A noise study is deemed completed if it was reviewed and commented on by DOTD and/or FHWA and considered final.

⁹ The FHWA Roadway Construction Noise Model (FHWA RCNM) may be used to model construction noise at a sensitive receptor. For highly complex and controversial projects in urban areas, the "Highway Construction Noise: Measurement, Prediction and Mitigation" (HICNOM) method may be used, but requires specific input.

For noise studies performed under past policies: If, during later stages of project development, changes occur that affect only a portion of the project requiring a reevaluation of the noise study for that portion, the policy in effect at the time of the original study will be applicable. When these situations arise, DOTD will consult with FHWA Division office on the project specific issues to ensure that FHWA is in agreement.
